### 2.3 INFLUENCE LINE FOR SHEARING FORCE, BENDING MOMENT AND SUPPORT REACTION COMPONENTS OF CONTINUOUS BEAMS

## Influence lines

An influence line is a graph showing, for any given frame or truss, the variation of any force or displacement quantity (such as shear force, bending moment, tension, deflection) for all positions of a moving unit load as it crosses the structure from one end to the other.

## Uses of influence line diagrams

(i) Influence lines are very useful in the quick determination of reactions, shear force, bending moment or similar functions at a given section under any given system of moving loads and
(ii) Influence lines are useful in determining the load position to cause maximum value of a given function in a structure on which load positions can vary.

## The principle on which indirect model analysis is based

The indirect model analysis is based on the Muller Breslau principle.
Muller Breslau principle has lead to a simple method of using models of structures to get the influence lines for force quantities like bending moments, support moments, reactions, internal shears, thrusts, etc.

To get the influence line for any force quantity,
(i) remove the resistant due to the force,
(ii) apply a unit displacement in the direction of the
(iii) plot the resulting displacement diagram. This diagram is the influence line for the force.

## Similitude

Similitude means similarity between two objects namely the model and the prototype with regard to their physical characteristics:
a. Geometric similitude is similarity of form
b. Kinematic similitude is similarity of motion
c. Dynamic and/or mechanical similitude is similarity of masses and/or forces.

## Example:

Determine the influence line for RA for continuous beam shown in fig. compute the IL ordinate at 1 m intervals

Fig.2.3.1

## Solution

I) Remove support A
ii) Apply a unit force at A and compute the deflection at any"x" on the $C B$ and BA
iii) divide these deflection by the displacement at A

Elastic curve due to RA =1

## Example:

Using Muller Breslau principle, draw the influence line for bending moment at the mid-point of span AB of the continuous beam ABC shown in fig, determine the influence line ordinate at suitable intervals and plot them.

Fig.2.3.4

## Solution

To get the influence line for MD
I)Introduce a hinge at D
ii) Apply a unit bending moment at D
iii)Determine the deflection $\mathrm{Y}_{\mathrm{XD}}$ and slope $\mathrm{Q}_{\mathrm{DD}}$ at D
iv) $\mathrm{Y}_{\mathrm{XD}} / \mathrm{Q}_{\mathrm{DD}}$ is the influence line ordinate at any x

Bending moment at any x is

$$
