

UNIT-IV

FOURIER TRANSFORMS

Fourier sine and cosine transforms:

Fourier sine Transform

We know that the Fourier sine integral is

$$f(x) = \frac{2}{\pi} \int_0^{\infty} \sin \lambda x \cdot \int_0^{\infty} f(t) \sin \lambda t \, dt \, d\lambda.$$

Replacing λ by s , we get

$$f(x) = \frac{2}{\pi} \int_0^{\infty} \sin s x \cdot \int_0^{\infty} f(t) \sin s t \, dt \, ds.$$

It follows that if

$$F_s(s) = \sqrt{2/\pi} \int_0^{\infty} f(t) \sin s t \, dt..$$

$$\text{i.e., } F_s(s) = \sqrt{2/\pi} \int_0^{\infty} f(x) \sin s x \, dx. \text{----- (1)}$$

$$\text{then } f(x) = \sqrt{2/\pi} \int_0^{\infty} F_s(s) \sin s x \, ds. \text{----- (2)}$$

The function $F_s(s)$, as defined by (1), is known as the **Fourier sine transform** of $f(x)$. Also the function $f(x)$, as given by (2), is called the **Inverse Fourier sine transform** of $F_s(s)$.

Fourier cosine transform

Similarly, it follows from the Fourier cosine integral

$$f(x) = \frac{2}{\pi} \int_0^{\infty} \cos \lambda x \cdot \int_0^{\infty} f(t) \cos \lambda t \, dt \, d\lambda.$$

that if $F_c(s) = \sqrt{(2/\pi)} \int_0^{\infty} f(x) \cos sx \, dx. \dots\dots\dots (3)$

then $f(x) = \sqrt{(2/\pi)} \int_0^{\infty} F_c(s) \cos sx \, ds. \dots\dots\dots (4)$

The function $F_c(s)$, as defined by (3), is known as the **Fourier cosine transform** of $f(x)$. Also the function $f(x)$, as given by (4), is called the **Inverse Fourier cosine transform** of $F_c(s)$.

Properties of Fourier sine and cosine Transforms

If $F_s(s)$ and $F_c(s)$ are the Fourier sine and cosine transforms of $f(x)$ respectively, the following properties and identities are true.

(1) Linearity property

$$F_s [a f(x) + b g(x)] = a F_s \{ f(x) \} + b F_s \{ g(x) \}.$$

and $F_c [a f(x) + b g(x)] = a F_c \{ f(x) \} + b F_c \{ g(x) \}.$

(2) Change of scale property

$$F_s [f(ax)] = (1/a) F_s [s/a].$$

and $F_c [f(ax)] = (1/a) F_c [s/a].$

(3) Modulation Theorem

i. $F_s [f(x) \sin ax] = (1/2) [F_c (s-a) - F_c (s+a)].$

i. $F_s [f(x) \cos ax] = (1/2) [F_s (s+a) + F_s (s-a)].$

$$\text{ii. } F_c[f(x) \cos ax] = (1/2) [F_c(s+a) + F_c(s-a)].$$

$$\text{iii. } F_s[f(x) \sin ax] = (1/2) [F_s(s+a) - F_s(s-a)].$$

Proof

The Fourier sine transform of $f(x) \sin ax$ is given by

$$\begin{aligned} F_s[f(x) \sin ax] &= \sqrt{2/\pi} \int_0^\infty (f(x) \sin ax) \sin sx \, dx. \\ &= (1/2) \sqrt{2/\pi} \int_0^\infty f(x) [\cos(s-a)x - \cos(s+a)x] \, dx. \\ &= (1/2) [F_c(s-a) - F_c(s+a)]. \end{aligned}$$

Similarly, we can prove the results (ii), (iii) & (iv).

(4) Parseval's identity

$$\begin{aligned} \int_0^\infty F_c(s) G_c(s) \, ds &= \int_0^\infty f(x) g(x) \, dx. \\ \int_0^\infty F_s(s) G_s(s) \, ds &= \int_0^\infty f(x) g(x) \, dx. \\ \int_0^\infty |F_c(s)|^2 \, ds &= \int_0^\infty |f(x)|^2 \, dx. \\ \int_0^\infty |F_s(s)|^2 \, ds &= \int_0^\infty |f(x)|^2 \, dx. \end{aligned}$$

Proof

$$\begin{aligned} \int_0^\infty F_c(s) G_c(s) \, ds &= \int_0^\infty F_c(s) \left[\sqrt{2/\pi} \int_0^\infty g(t) \cos st \, dt \right] ds \\ &= \int_0^\infty g(t) \left[\sqrt{2/\pi} \int_0^\infty F_c(s) \cos st \, ds \right] dt \\ &= \int_0^\infty g(t) f(t) \, dt \end{aligned}$$

$$\text{i.e., } \int_0^{\infty} F_c(s) G_c(s) ds = \int_0^{\infty} f(x) g(x) dx .$$

Similarly, we can prove the second identity and the other identities follow by setting $g(x) = f(x)$ in the first identity.

Property (5)

If $F_s(s)$ and $F_c(s)$ are the Fourier sine and cosine transforms of $f(x)$ respectively, then

$$(i) F_s\{x f(x)\} = - \frac{d}{ds} F_c(s) .$$

$$(ii) F_c\{x f(x)\} = - \frac{d}{ds} F_s(s) .$$

Proof

The Fourier cosine transform of $f(x)$,

$$\text{i.e., } F_c(s) = \sqrt{2/\pi} \int_0^{\infty} f(x) \cos sx \, dx.$$

Differentiating w.r.t s , we get

$$\begin{aligned} \frac{d}{ds} [F_c(s)] &= \sqrt{2/\pi} \int_0^{\infty} f(x) \{-x \sin sx\} dx . \\ &= - \sqrt{2/\pi} \int_0^{\infty} (x f(x)) \sin sx \, dx . \\ &= - F_s\{x f(x)\} \\ \text{i.e., } F_s\{x f(x)\} &= - \frac{d}{ds} \{F_c(s)\} \end{aligned}$$

Similarly, we can prove

$$F_c\{x f(x)\} = - \frac{d}{ds} \{F_s(s)\}$$

Example 8

Find the Fourier sine and cosine transforms of e^{-ax} and hence deduce the inversion formula.

The Fourier sine transform of $f(x)$ is given by

$$F_s\{f(x)\} = \sqrt{2/\pi} \int_0^{\infty} f(x) \sin sx \, dx.$$

$$\begin{aligned}
 \text{Now, } F_s\{e^{-ax}\} &= \sqrt{2/\pi} \int_0^{\infty} e^{-ax} \sin x \, dx. \\
 &= \sqrt{2/\pi} \left\{ \frac{e^{-ax} (-a \sin x - s \cos x)}{a^2 + s^2} \right\}_0^{\infty} \\
 &= \sqrt{2/\pi} \frac{s}{a^2 + s^2}, \text{ if } a > 0
 \end{aligned}$$

The Fourier cosine transform of $f(x)$ is given by

$$F_c\{f(x)\} = \sqrt{2/\pi} \int_0^{\infty} f(x) \cos x \, dx.$$

$$\begin{aligned}
 \text{Now, } F_c\{e^{-ax}\} &= \sqrt{2/\pi} \int_0^{\infty} e^{-ax} \cos x \, dx. \\
 &= \sqrt{2/\pi} \left\{ \frac{e^{-ax} (-a \cos x + s \sin x)}{a^2 + s^2} \right\}_0^{\infty} \\
 &= \sqrt{2/\pi} \frac{a}{a^2 + s^2}, \text{ if } a > 0
 \end{aligned}$$

Example 9

Find the Fourier cosine transform of $f(x) = \begin{cases} x, & \text{for } 0 < x < 1 \\ 2-x, & \text{for } 1 < x < 2 \\ 0, & \text{for } x > 2 \end{cases}$

The Fourier cosine transform of $f(x)$,

$$\begin{aligned}
 \text{i.e., } F_c\{f(x)\} &= \sqrt{2/\pi} \int_0^1 x \cos x \, dx + \sqrt{2/\pi} \int_1^2 (2-x) \cos x \, dx. \\
 &= \sqrt{2/\pi} \int_0^1 x \, d\left(\frac{\sin x}{s}\right) + \sqrt{2/\pi} \int_1^2 (2-x) \, d\left(\frac{\sin x}{s}\right) \\
 &= \sqrt{2/\pi} \left[x \left(\frac{\sin x}{s}\right) - (1) \frac{\cos x}{s^2} \right]_0^1 + \sqrt{2/\pi} \left[(2-x) \left(\frac{\sin x}{s}\right) - (-1) \frac{\cos x}{s^2} \right]_1^2
 \end{aligned}$$

$$\begin{aligned}
 &= \sqrt{2/\pi} \left\{ \frac{\sin s}{s} + \frac{\cos s}{s^2} - \frac{1}{s^2} \right\} \\
 &\quad + \left\{ -\frac{\cos 2s}{s^2} - \frac{\sin s}{s} + \frac{\cos s}{s^2} \right\} \\
 &= \sqrt{2/\pi} \left\{ \frac{2 \cos s}{s^2} - \frac{\cos 2s}{s^2} - \frac{1}{s^2} \right\}
 \end{aligned}$$

Example 10

Find the Fourier sine transform of e^{-x} . Hence show that $\int_0^{\infty} \frac{x \sin mx}{1+x^2} dx = \frac{\pi e^{-m}}{2}$, $m > 0$.

The Fourier sine transform of $f(x)$ is given by

$$\begin{aligned}
 F_s\{f(x)\} &= \sqrt{2/\pi} \int_0^{\infty} f(x) \sin sx \, dx. \\
 &= \sqrt{2/\pi} \int_0^{\infty} e^{-x} \sin sx \, dx. \\
 &= \sqrt{2/\pi} \left\{ \frac{e^{-x} (-\sin sx - s \cos sx)}{1+s^2} \right\}_0^{\infty} \\
 &= \sqrt{2/\pi} \frac{s}{1+s^2}.
 \end{aligned}$$

Using inversion formula for Fourier sine transforms, we get

$$\left\{ \sqrt{2/\pi} \int_0^{\infty} \sqrt{2/\pi} \frac{s}{1+s^2} \sin sx \, ds \right\} = e^{-x}$$

Replacing x by m ,

$$e^{-m} = (2/\pi) \int_0^{\infty} \frac{s \sin ms}{1+s^2} ds$$

$$= (2/\pi) \int_0^{\infty} \frac{x}{1+x^2} dx$$

Hence,
$$\int_0^{\infty} \frac{x \sin mx}{1+x^2} dx = \frac{\pi e^{-m}}{2}$$

Example 11

Find the Fourier sine transform of $\frac{x}{a^2+x^2}$ and the Fourier cosine transform of $\frac{1}{a^2+x^2}$.

To find the Fourier sine transform of $\frac{x}{a^2+x^2}$,

We have to find $F_s\{e^{-ax}\}$.

Consider,
$$F_s\{e^{-ax}\} = \sqrt{(2/\pi)} \int_0^{\infty} e^{-ax} \sin sx \, dx.$$

$$= \sqrt{(2/\pi)} \frac{s}{a^2 + s^2}$$

Using inversion formula for Fourier sine transforms, we get

$$e^{-ax} = \sqrt{(2/\pi)} \int_0^{\infty} \left\{ \sqrt{(2/\pi)} \frac{s}{a^2 + s^2} \right\} \sin sx \, ds.$$

i.e.,
$$\int_0^{\infty} \frac{s \sin sx}{s^2 + a^2} ds = \frac{\pi e^{-ax}}{2}, \quad a > 0$$

Changing x by s, we get

$$\int_0^{\infty} \frac{x \sin sx}{x^2 + a^2} dx = \frac{\pi e^{-as}}{2} \quad (1)$$

Now
$$F_s\left\{\frac{x}{x^2 + a^2}\right\} = \sqrt{(2/\pi)} \int_0^{\infty} \frac{x}{x^2 + a^2} \sin sx \, dx$$

$$= \sqrt{(2/\pi)} \frac{\pi e^{-as}}{2}, \quad \text{using (1)}$$

$$= \sqrt{\pi/2} e^{-as}$$

Similarly, for finding the Fourier cosine transform of $\frac{1}{a^2 + x^2}$, we have to find $F_c\{e^{-ax}\}$.

Consider, $F_c\{e^{-ax}\} = \sqrt{2/\pi} \int_0^{\infty} e^{-ax} \cos sx \, dx.$

$$= \sqrt{2/\pi} \frac{a}{a^2 + s^2}.$$

Using inversion formula for Fourier cosine transforms, we get

$$e^{-ax} = \sqrt{2/\pi} \int_0^{\infty} \left\{ \sqrt{2/\pi} \frac{a}{a^2 + s^2} \right\} \cos sx \, ds.$$

i.e., $\int_0^{\infty} \frac{\cos sx}{s^2 + a^2} \, ds = \frac{\pi e^{-ax}}{2a}$

Changing x by s, we get

$$\int_0^{\infty} \frac{\cos sx}{x^2 + a^2} \, dx = \frac{\pi e^{-as}}{2a} \quad (2)$$

Now, $F_c\left\{\frac{1}{x^2 + a^2}\right\} = \sqrt{2/\pi} \int_0^{\infty} \frac{1}{x^2 + a^2} \cos sx \, dx$
 $= \sqrt{2/\pi} \frac{\pi e^{-as}}{2a}, \text{ using (2)}$

$$= \sqrt{\pi/2} \frac{e^{-as}}{a}$$

Example 12

Find the Fourier cosine transform of $e^{-a x^2}$ and hence evaluate the Fourier sine transform

of $x e^{-a x^2}$.

The Fourier cosine transform of $e^{-a x}$ is given by

$$\begin{aligned}
 F_c\{e^{-a x}\} &= \sqrt{2/\pi} \int_0^{\infty} e^{-a x} \cos sx \, dx \\
 &= \text{Real part of } \sqrt{2/\pi} \int_0^{\infty} e^{-a x} e^{isx} \, dx \\
 &= \text{Real part of } \frac{1}{\sqrt{2}} e^{-s^2/4a} \quad (\text{Refer example (4) of section 4.4}) \\
 &= \frac{1}{a\sqrt{2}} e^{-s^2/4a} \quad (i)
 \end{aligned}$$

$$\text{But, } F_s\{x f(x)\} = - \frac{d}{ds} F_c(s)$$

$$\therefore F_s\{x e^{-a x^2}\} = - \frac{d}{ds} \left\{ \frac{1}{a \sqrt{2}} e^{-s^2 / 4a} \right\}, \text{ by (1)}$$

$$= - \frac{1}{\sqrt{2}} e^{-s^2 / 4a} (-s / 2a^2).a$$

$$= \frac{s}{2 \sqrt{2} \cdot a^3} e^{-s^2 / 4a}.$$

$$F_c[1 / \sqrt{x}] = 1 / \sqrt{s}$$

$$\text{and } F_s[1 / \sqrt{x}] = 1 / \sqrt{s}$$

This shows that $1 / \sqrt{x}$ is self-reciprocal.
