## UNIT I

### 1.5 THIN CYLINDERS

### 1.5.1 INTRODUCTION

The vessels such as boilers, compressed air receivers etc., are of cylindrical and spherical forms. These vessels are generally used for storing fluids (liquid or gas) under pressure. The walls of such vessels are thin as compared to their diameters. If the thickness of the wall of the cylindrical vessels is less than $1 / 15$ to $1 / 20$ of its internal diameter, the cylindrical vessel is known as thin cylinder. In case of thin cylinders, the stress distribution is assumed uniform over the thickness of the wall.

### 1.5.2 THIN CYLINDRICAL VESSEL SUBJECTED TO INTERNAL PRESSURE

Let $d=$ Internal diameter of the thin cylinder
$t=$ Thickness of the wall of the cylinder
$\mathrm{p}=$ Internal pressure of the fluid
$\mathrm{L}=$ Length of the cylinder

One of the internal pressure p , the cylindrical vessel may fail by splitting up in any one of the two ways.

The forces, due to pressure of the fluid acting vertically upwards and downwards on the thin cylinder, tend to burst the cylinder.

Cross-section perpendicular
 to the axis of vessel

The forces, due to pressure of the fluid, acting at the thin cylinder, tend to burst the thin cylinder.

### 1.5.3. STRESSES IN A THIN CYLINDRICAL VESSEL SUBJECTED TOINTERNAL PRESSURE

When a thin cylindrical vessel is subjected to internal fluid pressure, the stresses in the wall of the cylinder on the cross section along the axis and on the cross section perpendicular to the axis are set up. These stresses are tensile and are known as:

1. Circumferential stress (or hoop stress) and
2. Longitudinal stress

The name of the stress is given according to the direction in which the stress is acting. The stress acting along the circumference of the cylinder is called circumferential stress whereas the stress acting along the length of the cylinder (i.e., in the longitudinal direction) is known as longitudinal stress. The circumferential stress is also known as hoop stress. The stress set up in is circumferential stress whereas the stress set up in is longitudinal stress.

### 1.5.4 EXPRESSION FOR CIRCUMFERENTIAL STRESS (OR) HOOP STRESS

Consider a thin cylinder vessel subjected to an internal fluid pressure. The circumferential stress will be set up in the material of the cylinder, if the bursting of the cylinder takes place.

The expression for hoop stress or circumferential stress is obtained as given below.

Let $p=$ Internal pressure of the fluid

$$
\begin{aligned}
\mathrm{d} & =\text { Internal diameter of the cylinder } \\
\mathrm{t} & =\text { Thickness of the wall of the cylinder } \\
\sigma_{1} & =\text { Circumferential or hoop stress in the material }
\end{aligned}
$$

The bursting will take place if the force due to fluid pressure is more than the resisting force due to circumferential stress set up in the material. In the limiting case, the two forces should be equal.

Forces due to fluid pressure $=p \times$ Area on which $p$ is acting

$$
\begin{equation*}
=p \times(d \times L) . \tag{i}
\end{equation*}
$$

Forces due to circumferential stress

$$
\begin{array}{ll}
= & \sigma_{1} \times \text { Area on which } \sigma_{1} \text { is acting } \\
= & \sigma_{1} \times(\mathrm{L} \times \mathrm{t}+\mathrm{L} \times \mathrm{t}) \\
= & \sigma_{1} \times 2 \mathrm{Lt}=2 \sigma_{1} \times \mathrm{L} \times \mathrm{t} \ldots \ldots \ldots \ldots \ldots . \tag{ii}
\end{array}
$$

Equating (i) and (ii) we get

$$
\begin{aligned}
& \mathrm{P} \times \mathrm{d} \times \mathrm{L}=2 \sigma_{1} \times \mathrm{L} \times \mathrm{t} \\
& \sigma_{1}=\frac{\mathrm{Pd}}{2 \mathrm{t}} \quad \text { This stresses is tensile. }
\end{aligned}
$$

### 1.5.5 EXPRESSION FOR LONGITUDINAL STRESS

Consider a thin cylindrical vessel subjected to internal fluid pressure. The longitudinal stress will be set up in the material of the cylinder, if the bursting of the cylinder takes place along the section AB .

The longitudinal stress $\left(\sigma_{2}\right)$ developed in the material is obtained as:
Let $\quad \mathrm{p}=$ Internal pressure of fluid stored in thin cylinder
$\mathrm{d}=$ Internal diameter of cylinder
$\mathrm{t}=$ Thickness of the cylinder
$\sigma_{2}=$ Longitudinal stress in the material

Thus bursting will take place if the force due to fluid pressure acting on the ends of the cylinder is more than the resisting force due to longitudinal stress developed in the material. In the limiting case, both the forces should be equal.

Forces due to fluid pressure $\quad=\mathrm{p} \times$ Area on which p is acting

$$
=p \times \frac{\pi}{4} \mathrm{~d}^{2}
$$

Resisting force $\quad=\sigma_{2} \times$ area on which $\sigma_{2}$ is acting

$$
=\sigma_{2} \times \pi \mathrm{d} \times \mathrm{t}
$$

Hence in the limiting case
Force due to fluid pressure $\quad=$ resisting force

$$
\begin{aligned}
& \mathrm{p} \times^{\pi}{ }^{2}=\sigma_{2} \times \pi \mathrm{d} \times \mathrm{t} \\
& 4^{\mathrm{d}} \\
& \sigma_{2}=\frac{\mathrm{pd}}{4 \mathrm{t}}
\end{aligned}
$$

The stress $\sigma_{2}$ is also tensile equation can be written as

$$
\begin{gathered}
\sigma_{2}=\frac{p d}{2 \times 2 t} \\
\sigma_{2}=1 \times \sigma_{2} \quad 1
\end{gathered}
$$

$$
\left(\because \quad \sigma_{1}=\frac{p d}{2 t}\right)
$$

or Longitudinal stress=Half of circumferential stress
This also means that circumferential stress is two times the longitudinal stress Hence in the material of the cylinder the permissible stress should be less than the circumferential stress should not be greater than the permissible stress.

Maximum shear stress At any point in the material of the cylindrical shell, there are two principle stresses, namely a circumferential stress of magnitude $\sigma_{1}=\mathrm{pd} / 2 \mathrm{t}$ acting circumferentially and a longitudinal stress of magnitude $\sigma_{2}=\mathrm{pd} / 4 \mathrm{t}$ acting parallel to the axis of the shell. These two stresses are tensile and perpendicular to each other.

$$
\text { Maximum shear stress } \begin{aligned}
\tau_{\max } & =\sigma_{1}-\frac{\underline{\sigma}_{2}}{2} \\
& =\frac{\mathrm{pd}}{4 \mathrm{t}}-\frac{\overline{\mathrm{pd}}}{4 \mathrm{t}} \\
\tau_{\max } & =\frac{\mathrm{pd}}{8 \mathrm{t}}
\end{aligned}
$$

Problem 1.5.1: A cylindrical pipe of diameter 1.5 m and the thickness 1.5 cm is subjected to an internal fluid pressure of $1.2 \mathrm{~N} / \mathrm{mm}^{2}$ Determine (i) Longitudinal stress developed in the pipe, and (II)circumferential stress developed in the pipe.

## Given data:

Diameter of pipe

$$
\begin{aligned}
& \mathrm{d}=1.5 \mathrm{~m}=1.5 \times 10^{3} \mathrm{~mm} \\
& \mathrm{t}=1.5 \mathrm{~cm}=15 \mathrm{~mm}
\end{aligned}
$$

Thickness
Internal fluid pressure

## To find:

Longitudinal stress
$\sigma_{2}=$ ?
Circumferential stress
$\sigma_{1}=$ ?

## Solution:

As the ratio $\frac{\mathrm{t}}{\mathrm{d}}=\stackrel{1.5 \times 10-2}{1.5}=\frac{1}{100}$, which is less than $\frac{1}{20}$ hence this is a case of thin cylinder.

Here unit of pressure $(\mathrm{p})$ in $\mathrm{N} / \mathrm{mm}^{2}$ Hence the unit of $\sigma_{1}$ and $\sigma_{2}$ will also be in $\mathrm{N} / \mathrm{mm}^{2}$
(i) The longitudinal $\operatorname{stress}\left(\sigma_{2}\right)$ is given by equation

$$
\sigma_{2}=\frac{p d}{4 t}=\frac{1.2 \times 1.5 \times 10^{3}}{4 \times 15}=30 \mathrm{~N} / \mathrm{mm}^{2}
$$

(ii) The circumferential stress $\left(\sigma_{1}\right)$ is given by equation

$$
\sigma 1=\frac{\mathrm{pd}}{2 \mathrm{t}}=\frac{1.2 \times 1.5 \times 10^{3}}{2 \times 15}=60 \mathrm{~N} / \mathrm{mm}^{2}
$$

## Result:

Longitudinal stress $\quad \sigma_{2}=\mathbf{3 0} \mathbf{N} / \mathbf{m m}^{2}$
Circumferential stress $\quad \sigma_{1}=\mathbf{6 0} \mathbf{N} / \mathbf{m m}^{2}$
Problem1.5.2: A cylinder of internal diameter 2.5 m and of thickness 5 cm contains a gas. If the tensile stress in the material is not to exceed $80 \mathrm{~N} / \mathrm{mm}^{2}$ determine the internal pressure of the gas.

## Given data:

Internal diameter of cylinder
Thickness of the cylinder
Maximum permissible stress

$$
\begin{aligned}
\mathrm{d} & =2.5 \mathrm{~m}=2.5 \times 10^{3} \mathrm{~mm} \\
\mathrm{t} & =5 \mathrm{~cm}=50 \mathrm{~mm} \\
& =80 \mathrm{~N} / \mathrm{mm}^{2}
\end{aligned}
$$

## To find:

Internal pressure of the gas $\quad \mathrm{p}=$ ?

## Solution:

Maximum permissible stress is available in the circumferential stress ( $\sigma_{1}$ )

$$
\begin{array}{r}
\therefore \quad \text { circumferential stress }\left(\sigma_{1}\right)=\frac{p d}{2 t} \\
\\
80=\frac{p \times 2.5 \times 10^{3}}{2 \times 50} \\
>\quad \mathrm{p}=3.2 \mathrm{~N} / \mathrm{mm}^{2}
\end{array}
$$

## Result:

Internal pressure of the gas

$$
\mathrm{p}=3.2 \mathrm{~N} / \mathrm{mm}^{2}
$$

Problem 1.5.3: A cylinder of internal diameter 0.50 m contains air at a pressure of $7 \mathrm{~N} / \mathrm{mm}^{2}$ (gauge). If the maximum permissible stress induced in the material is $80 \mathrm{~N} / \mathrm{mm}^{2}$, find the thickness of the cylinder.

## Given data:

Internal dia of cylinder
Internal pressure of air,
Circumferential stress,

$$
\mathrm{d}=0.50 \mathrm{~m}=500 \mathrm{~mm}
$$

$$
\mathrm{p}=7 \mathrm{~N} / \mathrm{mm}^{2}
$$

$$
\sigma_{1}=80 \mathrm{~N} / \mathrm{mm}^{2} \quad(\because \text { maximum permissible stress })
$$

## To find:

Thickness of cylinder

$$
\mathrm{t}=\text { ? }
$$

## Solution:

$$
\text { Wkt Circumferential stress }\left(\sigma_{1}\right)=\begin{aligned}
& \text { pd } \\
& 2 \mathrm{t} \\
& 80=\frac{7 \times 500}{2 \times \mathrm{t}}
\end{aligned}
$$

>>

$$
\mathrm{t}=21.88 \mathrm{~mm}
$$

If the value t is taken more than $21.875 \mathrm{~mm}(\mathrm{sat} \mathrm{t}=21.88 \mathrm{~mm})$, the stress induced will be less than $80 \mathrm{~N} / \mathrm{mm}^{2}$.

Hence take $\mathrm{t}=21.88 \mathrm{~mm}$ or say 22 mm

## Result:

Thickness of cylinder

$$
\mathrm{t}=22 \mathrm{~mm}
$$

Problem 1.5.4: A thin cylinder of internal diameter 1.25 m contains a fluid at an internal pressure of $2 \mathrm{~N} / \mathrm{mm}^{2}$. Determine the maximum thickness of the cylinder if (i) The longitudinal stress is not to exceed $30 \mathrm{~N} / \mathrm{mm}^{2}$ and (ii)The circumferential stress is not to exceed $45 \mathrm{~N} / \mathrm{mm}^{2}$

## Given data:

Internal dia of cylinder, $\quad \mathrm{d}=1.25 \mathrm{~m}=1.25 \times 10^{3} \mathrm{~mm}$
Internal pressure of fluid, $p=2 \mathrm{~N} / \mathrm{mm}^{2}$
Longitudinal stress

$$
\sigma_{2}=30 \mathrm{n} / \mathrm{mm}^{2}
$$

Circumferential stress, $\quad \sigma_{1}=45 \mathrm{~N} / \mathrm{mm}^{2}$

## To find:

Thickness of cylinder $\quad t=$ ?

## Solution:

$$
\begin{aligned}
& \text { Wkt Circumferential stress }\left(\sigma_{1}\right)=\begin{array}{c}
p d \\
2 \mathrm{t}
\end{array} \\
& 45=\frac{2 \times 1.25 \times 10^{3}}{2 \times t} \\
& \text { >> } \\
& \mathrm{t}=27.7 \mathrm{~mm} \\
& \text { Wkt, longitudinal stress } \quad \sigma_{2}=\frac{\mathrm{pd}}{4 \mathrm{t}} \\
& 30=\frac{2 \times 1.25 \times 10^{3}}{4 \times t} \\
& \gg \quad \mathrm{t}=28.0 \mathrm{~mm}
\end{aligned}
$$

from the above two thickness value it is clear that t should not be less than 27.7 mm . Hence take $\mathrm{t}=28 . \mathrm{mm}$.

## Result:

Thickness of cylinder $\quad \mathrm{t}=28 \mathrm{~mm}$
Problem 1.5.5: A water main 80 cm diameter contains water at a pressure head of 100 m . If the weight density of water is $9810 \mathrm{~N} / \mathrm{m}^{3}$, find the thickness of the metal required forthe water main given the permission stress as $20 \mathrm{~N} / \mathrm{mm}^{2}$.

## Given data:

Diameter of main,

$$
\mathrm{d}=80 \mathrm{~cm}=800 \mathrm{~mm}
$$

Pressure head of water, $\quad \mathrm{h}=100 \mathrm{~m}=100 \times 10^{3} \mathrm{~mm}$
Weight density of water $\quad \omega=\rho \times \mathrm{g}=1000 \times 9.81=9810 \mathrm{~N} / \mathrm{m}^{3}$
Permissible stress $\quad=20 \mathrm{~N} / \mathrm{mm}^{2}$

## To find:

Thickness of the metal $t=$ ?

## Solution:

Permissible stress is equal to circumferential stress( $\sigma 1$ )
Pressure of water inside the water main,

$$
\mathrm{p}=\rho \times \mathrm{g} \times \mathrm{h}=\omega . \mathrm{h}=9810 \times 100 \mathrm{~N} / \mathrm{m}^{2}
$$

Here $\sigma_{1}$ is in $N / \mathrm{mm}^{2}$ hence pressure ( p ) should be $\mathrm{N} / \mathrm{mm}^{2}$. The value of p in $\mathrm{N} / \mathrm{mm}^{2}$ is given as

$$
\begin{aligned}
\mathrm{P} & =9810 \times 100 / 1000^{2} \\
& =0.981 \mathrm{~N} / \mathrm{mm}^{2}
\end{aligned}
$$

Wkt Circumferential stress $\sigma_{1}=\begin{gathered}\mathrm{pd} \\ 2 \mathrm{t}\end{gathered}$

$$
20=\frac{0.981 \times 800}{2 \times t}
$$

$$
\mathrm{t}=20 \mathrm{~mm}
$$

Result:
Thickness of the metal $t=20 \mathrm{~mm}$

## EFFICIENCY OF A JOINT

The cylindrical shells such as boilers are having two types of joints namely longitudinal joint and circumferential joint. In case of a joint, holes are made in the material of the shell for the rivets. Due to the holes, the area offering resistance decreases. Due to the decreases in area, the stress developed in the material of the shell will be more.

Hence in case of riveted shell the circumferential and longitudinal stresses are greater than what are given by eqn. If the efficiency of a longitudinal joint and circumferential joint are given then the circumferential and longitudinal stresses are obtained as:

Let $\quad \eta_{I}=$ Efficiency of a longitudinal joint, and
$\eta_{c}=$ Efficiency of the circumferential joint.
Then the circumferential stress $\left(\sigma_{1}\right)$ is given as

$$
\sigma_{1}=\frac{\mathrm{pd}}{2 \mathrm{tx} \prod_{1}}
$$

and the longitudinal stress $\left(\sigma_{2}\right)$ is given as

$$
\sigma_{2}=\frac{\mathrm{pd}}{4 \mathrm{t} \times \eta_{\mathrm{c}}}
$$

Problem 1.5.6: A boiler is subjected to an internal steam pressure of $2 \mathrm{~N} / \mathrm{mm}^{2}$. The thickness of boiler plate is 2.0 cm and permissible tensile stress is $120 \mathrm{~N} / \mathrm{mm}^{2}$. Find out the maximum diameter when efficiency of longitudinal joint is $90 \%$ and that of circumferential joint is $40 \%$

## Given data:

$$
\begin{array}{lc}
\text { Internal steam pressure } & p=2 \mathrm{~N} / \mathrm{mm}^{2} \\
\text { Thickness of boiler plate } & t=2.0 \mathrm{~cm}=20 \mathrm{~mm} \\
\text { Permissible tensile stress } & =120 \mathrm{~N} / \mathrm{mm}^{2} \\
\text { Efficiency of Longitudinal joint, } \eta_{I}=90 \%=0.90 \\
\text { Efficiency of circumferential joint, } \eta_{c}=40 \%=0.40
\end{array}
$$

## To find:

Find the maximum diameter $=$ ?

## Solution:

For Circumferential stress $\sigma_{1}=120 \mathrm{~N} / \mathrm{mm}^{2}$

$$
\text { Wkt Circumferential stress } \begin{aligned}
\sigma_{1} & =\frac{p d}{2 \mathrm{t} \times \eta_{1}} \\
120 & =\frac{2 \times \mathrm{d}}{2 \times 20 \times 0.90}
\end{aligned}
$$

$$
\begin{equation*}
\gg \quad d=2160 \mathrm{~mm} \tag{i}
\end{equation*}
$$

For longitudinal stress $\sigma_{2}=120 \mathrm{~N} / \mathrm{mm}^{2}$

$$
\begin{align*}
\text { Wkt, longitudinal stress } & \sigma_{2} & =\frac{\mathrm{pd}}{4 \mathrm{t} \times \eta_{\mathrm{c}}} \\
& 120 & =\frac{2 \times \mathrm{d}}{4 \times 20 \times 0.40} \\
\gg & \mathrm{~d} & =1920 \mathrm{~mm} \ldots . .
\end{align*}
$$

hence suitable maximum diameter $\mathrm{d}=1920 \mathrm{~mm}$.
Note: If $d$ is taken as equal to 216 cm the longitudinal stress will be more than the given permissible value as shown below.

$$
\begin{aligned}
& \sigma_{2}=\frac{\mathrm{pd}}{4 \mathrm{t} \times \eta_{\mathrm{c}}} \\
& \sigma_{2}=\frac{2 \times 216}{4 \times 20 \times 0.40}=135 \mathrm{~N} / \mathrm{mm}^{2}
\end{aligned}
$$

Problem 1.5.7: A boiler shell is to be mad of 15 mm thick plate having a limiting tensile stress of $120 \mathrm{~N} / \mathrm{mm}^{2}$. If the efficiencies of the longitudinal and circumferential joints are $70 \%$ and $30 \%$ respectively determine;
(i) The max permissible diameter of the shell for an internal pressure of $2 \mathrm{~N} / \mathrm{mm}^{2}$
(ii) permissible intensity of internal pressure when the shell diameter is 1.5 m

## Given data:

Thickness of boiler shell, $\quad t=15 \mathrm{~mm}$
Limiting tensile stress $\quad=120 \mathrm{~N} / \mathrm{mm}^{2}$
Efficiency of longitudinal joint $\quad \eta_{1}=70 \%=0.70$
Efficiency of circumferential joint $\eta_{c}=30 \%=0.30$

## To find:

Maximum permissible diameter $\mathrm{d}=$ ?
Internal pressure $\quad \mathrm{p}=$ ?
Solution:
i) Maximum permissible diameter for an internal pressure $p=2 \mathrm{~N} / \mathrm{mm}^{2}$

The boiler shell should be designed for the limiting tensile stress of $120 \mathrm{~N} / \mathrm{mm}^{2}$. First consider the limiting tensile stress as circumferential stress and then as longitudinal stress. The minimum diameter of the two case will satisfy the condition.
(a) Taking limiting tensile stress $=$ circumferential stress $\sigma_{1}=120 \mathrm{~N} / \mathrm{mm}^{2}$

Wkt the circumferential stress $\sigma_{1}$

$$
\begin{aligned}
& \sigma_{1}=\frac{\mathrm{pd}}{2 \mathrm{t} \times \eta_{\mathrm{l}}} \\
& 120=\frac{2 \times \mathrm{d}}{2 \times 15 \times 0.70}
\end{aligned}
$$

>>

$$
\begin{equation*}
\mathrm{d}=2160 \mathrm{~mm} \tag{i}
\end{equation*}
$$

(b) Taking limiting tensile stress $=$ longitudinal stress $\sigma_{2}=120 \mathrm{~N} / \mathrm{mm}^{2}$

Wkt the longitudinal stress $\sigma_{2}$

$$
\begin{aligned}
\sigma_{2} & =\frac{\mathrm{pd}}{4 \mathrm{t} \times \eta_{\mathrm{c}}} \\
120 & =\frac{2 \times \mathrm{d}}{4 \times 15 \times 0.30} \\
>\quad \mathrm{d} & =1080 \mathrm{~mm}
\end{aligned}
$$

(ii) Permissible intensity of internal pressure when the shell diameter is 1.5 m

$$
\mathrm{d}=1.5 \mathrm{~m}=1500 \mathrm{~mm}
$$

(a) Taking limiting tensile stress=circumferential $\operatorname{stress}\left(\sigma_{1}\right)=120 \mathrm{~N} / \mathrm{mm}^{2}$

Wkt the circumferential stress $\sigma_{1}$

$$
\begin{equation*}
\gg \quad \mathrm{p}=1.68 \mathrm{~N} / \mathrm{mm}^{2} \tag{i}
\end{equation*}
$$

$$
\begin{aligned}
\sigma_{1} & =\frac{p d}{2 \mathrm{t} \times \eta_{1}} \\
120 & =\frac{\mathrm{p} \times 1500}{2 \times 15 \times 0.70} \\
\mathrm{p} & =1.68 \mathrm{~N} / \mathrm{mm}^{2} .
\end{aligned}
$$

(b) Taking limiting tensile stress $=$ longitudinal stress $\sigma_{2}=120 \mathrm{~N} / \mathrm{mm}^{2}$

Wkt the longitudinal stress $\sigma_{2}$

$$
\begin{aligned}
& \sigma_{2}=\mathrm{pd} \\
& 4 \mathrm{t} \times \eta_{\mathrm{c}} \\
& 120=\frac{\mathrm{p} \times 1500}{4 \times 15 \times 0.30}
\end{aligned}
$$

$$
\begin{equation*}
\mathrm{p}=1.44 \mathrm{~N} / \mathrm{mm}^{2} \tag{ii}
\end{equation*}
$$

value of pressure given by (i) \& (ii)
Max permissible internal pressure is taken as the minimum value of (i) \& (ii) $\mathrm{p}=1.44 \mathrm{~N} / \mathrm{mm}^{2}$

$$
\begin{aligned}
\sigma_{2} & =\frac{\mathrm{pd}}{4 \mathrm{t} \times \eta_{\mathrm{c}}} \\
& =\frac{1.44 \times 1500}{4 \times 15 \times 0.30}=140 \mathrm{~N} / \mathrm{mm}^{2} .
\end{aligned}
$$

Problem 1.5.8: A cylinder of thickness 1.5 cm , has to withstand maximum internal pressure of $1.5 \mathrm{~N} / \mathrm{mm} 2$. If the ultimate tensile stress in the material of the cylinder is $300 \mathrm{~N} / \mathrm{mm} 2$ factor of safety 3.0 and joint efficiency $80 \%$ determine the diameter of the cylinder.

## Given Data:

| Thickness of cylinder | $t=1.5 \mathrm{~cm}=15 \mathrm{~mm}$ |
| :--- | :--- |
| internal pressure | $\mathrm{p}=1.5 \mathrm{~N} / \mathrm{mm}^{2}$ |
| ultimate tensile stress | $=300 \mathrm{~N} / \mathrm{mm}^{2}$ |
| FOS | $=3.0$ |
| joint efficiency | $=80 \%$ |

## To find:

Diameter of the cylinder $d=$ ?

## Solution:

Working stress, $\quad \sigma_{1}=$ Ultimate tensile stress/FOS

$$
=300 / 3
$$

$$
=100 \mathrm{~N} / \mathrm{mm}^{2}
$$

Joint efficiency, $\quad \eta=80 \%=0.80$
Joint efficiency means the efficiency of longitudinal joint $\eta_{1}$
The stress corresponding to longitudinal joint is given by equation

$$
\begin{aligned}
& \sigma_{1}=\frac{\mathrm{pd}}{2 \mathrm{tx} \mathrm{I}_{1}} \\
& 100=\frac{}{d} \\
& \times \\
& 2 \times \\
& 15 \\
& \times 0 \\
& \text {. } 80
\end{aligned}
$$

>

$$
\mathrm{d}=1600 \mathrm{~mm}=1.6 \mathrm{~m}
$$

### 1.5.7. EFFECT OF INTERNAL PRESSURE ON THE DIMENSIONS OF A THIN CYLINDRICAL SHELL

When a fluid having internal pressure ( p ) is stored in a thin cylindrical shell, due to internal pressure of the fluid the stresses set up at any point of the material of the shell are:
(i) Hoop circumferential stress $\left(\sigma_{1}\right)$, acting on longitudinal section.
(ii)Longitudinal stress( $\sigma_{2}$ ) acting on the circumferetial section.

These stresses are principal stresses, as they are acting on principal planes. The stress in the third principal plane is zero as the thickness ( t ) of the cylinder is very small.

Actually the stress in the third principal plane is radial stress which is very small for thin cylinders and can be neglected.

Let $\mathrm{p}=$ Internal pressure of fluid
L= Length of cylindrical shell
$\mathrm{d}=$ Diameter of the cylindrical shell
$t=$ Thickness of the cylindrical shell
$\mathrm{E}=$ Modulus of Elasticity for the material of the shell
$\sigma_{1}=$ Hoop stress in the material
$\sigma_{2}=$ Longitudinal stress in the material
$\delta \mathrm{d}=$ change in diameter due to stresses set up in the material
$\delta \mathrm{L}=$ change in length
$\delta \mathrm{v}=$ change in volume
$\mu=$ poison ratio
The value of $\sigma_{1}$ and $\sigma_{2}$ are given by eqn and as

$$
\begin{aligned}
& \sigma_{1}=\frac{p d}{2 t} \\
& \sigma_{2}=\begin{array}{c}
p d \\
4 t
\end{array}
\end{aligned}
$$

Let $\mathrm{e}_{1}=$ circumferential strain, $\mathrm{e}_{2}=$ Longitudinal strain,

Then circumferential strain,

$$
\begin{aligned}
\mathrm{e} & =\frac{\sigma_{1}}{E}-\mu \frac{\sigma_{2}}{E} \\
& =\frac{p d}{2 t E}-\mu \frac{p d}{4 t E} \\
& =\frac{p d}{2 t E}\left(1-\frac{1}{2}\right)
\end{aligned}
$$

and longitudinal strain,

$$
\begin{aligned}
\mathrm{e}_{2} & =\frac{\sigma_{2}}{E}-\mu \frac{\sigma_{1}}{E} \\
& =\frac{p d}{4 t E}-\mu \frac{p d}{2 t E} \\
& =\frac{p d}{2 t E}\left(\frac{1}{2}-\mu\right)
\end{aligned}
$$

But circumferential strain is also given as,

$$
\begin{aligned}
\mathrm{e}_{1} & =\frac{\text { Change in circumferential due to pressure }}{\text { original circumference }} \\
& =\frac{\text { Final circumference-original circumference }}{\text { original circumference }} \\
& =\frac{\pi(\mathrm{d}+\delta \mathrm{d})-\pi \mathrm{d}}{\pi \mathrm{~d}} \\
& =\frac{\pi \mathrm{d}+\pi \delta \mathrm{d}-\pi \mathrm{d}}{\pi \mathrm{~d}} \\
& =\frac{\delta \mathrm{d}}{\mathrm{~d}}
\end{aligned}
$$

Equating the two values of $\mathrm{e}_{1}$ given by equations and we get

$$
\frac{\delta \mathrm{d}}{\mathrm{~d}}=\frac{p d}{2 t E}\left(1-{ }_{2}^{\mu}\right)
$$

Change in diameter

$$
\delta \mathrm{d}=\frac{p d^{2}}{2 t E}\left(1-{ }_{2}^{\mu}\right)
$$

similarly longitudinal strain is also given as,

$$
\begin{aligned}
& \mathrm{e}_{2}=\text { change in length due to pressure/original length } \\
& =\delta \mathrm{L} / \mathrm{L}
\end{aligned}
$$

Equating the two values of $\mathrm{e}_{2}$ given by equation

$$
\delta \mathrm{L} / \mathrm{L}=\begin{gathered}
p d \\
2 t E
\end{gathered}\left(\begin{array}{l}
1 \\
2
\end{array}-\mu\right)
$$

Change in length

$$
\delta \mathrm{L}=\frac{p d L}{2 t E}\left(\begin{array}{c}
1 \\
2
\end{array}-\mu\right)
$$

Volumetric strain.
It is defined as change in volume divided by original volume
Volumetric strain $=\frac{\delta \mathrm{V}}{\mathrm{V}}$
But change in volume $(\delta \mathrm{V})=$ Final volume - Original volume
Original volume $(\mathrm{V})=$ Area of cylindrical shell $\times$ Length

$$
=\frac{\pi}{4} \times d^{2} \times \mathrm{L}
$$

Final volume $=($ Final area of cross section $) \times$ Final length

$$
\begin{aligned}
& =\frac{\pi}{4}(d+\delta d)^{2} \times(\mathrm{L}+\delta \mathrm{L}) \\
& =\frac{\pi}{4}\left[d^{2}+(\delta d)^{2}+2 d \delta d\right] \times[\mathrm{L}+\delta \mathrm{L}] \\
& =\frac{\pi}{4}\left[d^{2} L+(\delta d)^{2} L+2 d L \delta d+d^{2} \delta \mathrm{~L}+(\delta d)^{2} \delta \mathrm{~L}+2 d \delta d \delta \mathrm{~L}\right]
\end{aligned}
$$

Neglecting the smaller quantities such as $(\delta d)^{2} L,(\delta d)^{2} \delta \mathrm{~L}$ and $2 d \delta d \delta \mathrm{~L}$, we get

Final volume $=\frac{\pi}{4}\left[d^{2} L+2 d L \delta d+d^{2} \delta L\right]$
Change in volume ( $\delta \mathrm{V}$ )

$$
\begin{aligned}
& ={ }_{4}^{\pi}\left[d^{2} L+2 d L \delta d+d^{2} \delta L\right]-{ }_{4}^{\pi} \times d^{2} \times L \\
& ={ }_{4}^{\pi}\left[2 d L \delta d+d^{2} \delta L\right]
\end{aligned}
$$

Then volumetric strain $=\delta \mathrm{V} / \mathrm{V}$

$$
\begin{aligned}
& =\frac{\pi}{4}\left[2 d L \delta d+d^{2} \delta \mathrm{~L}\right] \\
& =\frac{\pi}{4} \times d \times \mathrm{L} \\
& =2 \frac{\delta d}{d}+\frac{\delta L}{L}=2 \mathrm{e}_{1}+\mathrm{e}_{2} \\
& =2 \times \frac{p d}{2 t E}\left(1-{ }_{2}^{\mu}\right)+\frac{\gamma d}{2 t E}(1-\mu)
\end{aligned}
$$

Substitutes the value of $\mathrm{e}_{1}$ and $\mathrm{e}_{2}$

$$
\begin{aligned}
& ={ }_{2 t E}^{p d}\left(2-\frac{2 \mu}{2}+\frac{1}{2}-\mu\right) \\
= & \frac{p d}{2 t E}\left(2+\frac{1}{2}-\mu-\mu\right) \\
= & { }^{p d}\left({ }_{2}\right. \\
2 t E & -2 \mu)
\end{aligned}
$$

Also change in volume $(\delta \mathrm{V})=\mathrm{V}\left(2 \mathrm{e}_{1}+\mathrm{e}_{2}\right)$
Problem 1.5.9 Calculate (i) the change in diameter, (ii) change in length (iii)change in volume of a thin cylindrical shell 100 cm diameter, 1 cm thick and 5 m long when subjected to internal pressure of $3 \mathrm{~N} / \mathrm{mm} 2$. Take the value of $\mathrm{E}=2 \times 105 \mathrm{~N} / \mathrm{mm}^{2}$ and poisons ratio $\mu=0.3$

## Given data:

Diameter of shell

$$
\mathrm{d}=100 \mathrm{~cm}=1000 \mathrm{~mm}
$$

| Thickness of shell | $t=1 \mathrm{~cm}=10 \mathrm{~mm}$ |
| :--- | :--- |
| Length of shell | $\mathrm{L}=5 \mathrm{~m}=5 \times 10^{3} \mathrm{~mm}$ |
| Internal pressure | $\mathrm{p}=3 \mathrm{~N} / \mathrm{mm}^{2}$ |
| Young's modulus | $\mathrm{E}=2 \times 10^{5}$ |
| Poisson's ratio | $\mu=0.30$ |

## To find:

(i) change in diameter $\delta \mathrm{d}=$ ?
(ii) change in length $\quad \delta \mathrm{L}=$ ?
(iii) change in volume $\quad \delta V=$ ?

## Solution:

(i) Change in diameter ( $\delta \mathrm{d}$ ) is given by equation

$$
\begin{aligned}
\delta \mathrm{d} & =\frac{p d^{2}}{2 t E}\left(1-{ }_{2}^{\mu}\right) \\
& =\begin{array}{c}
3 \times 1000^{2} \\
2 \times 10 \times 2 \times 10^{5}
\end{array}\left(1-\frac{0.30}{2}\right) \\
& =0.6375 \mathrm{~mm}
\end{aligned}
$$

(ii) Change in length $(\delta \mathrm{L})$ is given by equation

$$
\begin{aligned}
\delta \mathrm{L} & =\frac{p d L}{2 t E}\left(\frac{1}{2}-\mu\right) \\
& =\frac{3 \times 1000 \times 5 \times 10^{3}}{2 \times 10 \times 2 \times 10^{5}}\left(\begin{array}{l}
1 \\
2
\end{array}-0.30\right) \\
& =0.75 \mathrm{~mm}
\end{aligned}
$$

(iii) change in volume ( $\delta \mathrm{V}$ ) is given by equation

$$
\begin{aligned}
\delta \mathrm{V} & =\mathrm{V}\left[2 \mathrm{e}_{1}+\mathrm{e}_{2}\right] \\
& =\mathrm{V}\left[2 \times{ }_{\mathrm{d}}^{\delta \mathrm{d}}+\frac{\delta L}{L}\right]
\end{aligned}
$$

substituting the values of $\delta \mathrm{d}, \delta \mathrm{L}, \mathrm{d}$ and L , we get

$$
\delta \mathrm{V}=\mathrm{V}\left[2 \times \frac{0.06375}{1000}+\frac{0.075}{5 \times 10^{3}}\right]
$$

Where V=original volume $=\frac{\pi}{4} \times d^{2} \times \mathrm{L}=\frac{\pi}{4} \times 1000^{2} \times 5 \times 10^{3}=3.92 \times 10^{9} \mathrm{~mm}^{3}$

$$
\begin{aligned}
\delta \mathrm{V} & =3.92 \times 10^{9}\left[2 \times \frac{0.06375}{1000}+\frac{0.075}{5 \times 10^{3}}\right] \\
& =5.595 \times 10^{6} \mathrm{~mm}^{3}
\end{aligned}
$$

Problem 1.5.10: A cylindrical shell 90 cm long20cm internal diameter having thickness of metal as 8 mm is filled with fluid at atmospheric pressure. If an additional $20 \mathrm{~cm}^{3}$ of fluid is pumped into the cylinder find (i)the pressure exerted by the fluid on the cylinderand (ii) the hoop stress induced. Take $\mathrm{E}=2 \times 10^{5} \mathrm{~N} / \mathrm{mm}^{2}$ and $\mu=0.3$

## Given data:

Length of cylinder $\quad \mathrm{L}=90 \mathrm{~cm}=900 \mathrm{~mm}$
Diameter od cylinder $\mathrm{d}=20 \mathrm{~cm}=200 \mathrm{~mm}$
Thickness of cylinder $\quad \mathrm{t}=8 \mathrm{~mm}$
Increase in volume $\quad \delta \mathrm{V}=$ Volume of additional fluid $=20 \times 10^{3} \mathrm{~mm}^{3}$

$$
\begin{aligned}
E & =2 \times 10^{5} \mathrm{~N} / \mathrm{mm}^{2} \\
\mu & =0.3
\end{aligned}
$$

To find:
(i) pressure exerted by the fluid
(ii) hoop stress induced

Solution:
volume of cylinder $\mathrm{V}=\frac{\pi}{4}{ }^{2} \times \mathrm{L}={ }_{4}^{\pi} \times 200^{2} \times 900=2.827 \times 10^{7} \mathrm{~mm}{ }^{3}$
(i) Let $\mathrm{p}=$ pressure of exerted by fluid on the cylinder

Now using eqn volumetric strain is given as

$$
\begin{align*}
& \delta V=2 \mathrm{e}_{1}+\mathrm{e}_{2} \\
& V \\
& 20 \times 10^{3} \\
& 2.827 \times 10^{7}=2 \mathrm{e}_{1}+\mathrm{e}_{2} \ldots \tag{i}
\end{align*}
$$

But $e_{1}$ and $e_{2}$ are circumferential and longitudinal strains and given by equation and respectively as

$$
\begin{aligned}
& \mathrm{e}_{1}=\frac{p d}{2 t E}\left(1-{ }_{2}^{\mu}\right) \\
& \mathrm{e} 2=\frac{p d}{2 t E}\left(\frac{1}{2}-\mu\right)
\end{aligned}
$$

substitute these values in eqn (i) we get

$$
\frac{20 \times 10^{3}}{2.827 \times 10^{7}}=2 \frac{p d}{2 t E}\left(1-\frac{\mu}{2}\right)+\frac{p d}{2 t E}\left(\frac{1}{2}-\mu\right)
$$

$$
\begin{aligned}
\frac{20 \times 10^{3}}{2.827 \times 10^{7}} & =2 \frac{p \times 200}{2 \times 8 \times 2 \times 105}\left(1-\frac{0.3}{2}\right)+\frac{p \times 200}{2 \times 8 \times 2 \times 10^{5}}\left(\frac{1}{2}-0.3\right) \\
p & =5.386 \mathrm{~N} / \mathrm{mm}^{2}
\end{aligned}
$$

(ii) Hoop stress $\left(\sigma_{1}\right)$ is given by equation

$$
\begin{aligned}
\sigma_{1}=\frac{p d}{2 t} & =\frac{5.386 \times 200}{2 \times 8} \\
& =67.33 \mathrm{~N} / \mathrm{mm}^{2}
\end{aligned}
$$

Result:
(i) pressure exerted by the fluid $(\mathrm{p})=5.386 \mathrm{~N} / \mathrm{mm}^{2}$
(ii) hoop stress induced $\quad\left(\sigma_{1}\right)=67.33 \mathrm{~N} / \mathrm{mm}^{2}$

Problem 1.5.11: A cylindrical vessel whose ends are closed by means of rigid flanges plates, is made of steel plate 3 mm thick. The length and the internal diameter of the vessel are 50 cm and 25 cm respectively. Determine the longitudinal and hoop stress in the cylindrical shell due to an internal fluid pressure of $3 \mathrm{~N} / \mathrm{mm} 2$. Also calculate the increase in length, diameter and volume of the vessel. Take $\mathrm{E}=2 \times 10^{7} \mathrm{~N} / \mathrm{mm} 2$ and $\mu=0.3$

## Given data:

| Thickness | $\mathrm{t}=3 \mathrm{~mm}$ |
| :--- | :--- |
| Length of the cylindrical vessel | $\mathrm{L}=50 \mathrm{~cm}=500 \mathrm{~mm}$ |
| Internal diameter | $\mathrm{d}=25 \mathrm{~cm}=250 \mathrm{~mm}$ |
| Internal fluid pressure | $\mathrm{p}=3 \mathrm{~N} / \mathrm{mm}^{2}$ |
| Young's modulus | $\mathrm{E}=2 \times 10^{5} \mathrm{~N} / \mathrm{mm}^{2}$ |
| Poisson's ratio | $\mu=0.3$ |

## To find:

Longitudinal stress and hoop stress $=$ ?
Increase in length, diameter and volume $=$ ?

## Solution:

$$
\text { Using equation for hoop stress } \quad \begin{aligned}
\sigma_{1} & =\frac{p d}{2 t}=\frac{3 \times 250}{2 \times 3} \\
& =125 \mathrm{~N} / \mathrm{mm}^{2} \\
\text { Using equation for longitudinal stress } \quad \sigma_{2} & =\frac{p d}{4 t}=\frac{3 \times 250}{4 \times 3} \\
& =62.5 \mathrm{~N} / \mathrm{mm}^{2}
\end{aligned}
$$

Using equation for circumferential strain $\mathrm{e}_{1}=\frac{\sigma_{1}}{E}-\mu \frac{\sigma_{2}}{E}=={\underset{E}{E}}_{1}^{\left(\sigma_{1}-\frac{\sigma_{2}}{2}\right)}$

And longitudinal strain,

$$
\begin{aligned}
& =\frac{1}{2 \times 10^{5}}\left(125-\frac{62.5}{2}\right) \\
& =53.125 \times 10^{-5} \\
\mathrm{e}_{2} & =\frac{\sigma_{2}}{E}-\mu \frac{\sigma_{1}}{E}
\end{aligned}
$$

But circumferential strain is also given by equation

$$
\mathrm{e}_{1}=\delta \mathrm{d} / \mathrm{d}
$$

Equating the two values of circumferential strain $\mathrm{e}_{1}$ we get

$$
\begin{aligned}
\delta \mathrm{d} / \mathrm{d} & =53.125 \times 10^{-5} \\
\delta \mathrm{~d} & =53.125 \times 10^{-5} \times \mathrm{d} \\
& =53.125 \times 10^{-5} \times 250 \\
& =0.133 \mathrm{~mm}
\end{aligned}
$$

Increase in diameter $\delta \mathrm{d}=0.133 \mathrm{~mm}$
Longitudinal strain is given by equation, $\quad \mathrm{e}_{2}=\delta \mathrm{L} / \mathrm{L}$, But $_{2}=\underline{\underline{\underline{\sigma}} \underline{2}} E-\mathrm{m}_{E}^{\underline{\sigma_{1}}}$ Then

$$
\begin{aligned}
\delta \mathrm{L} / \mathrm{L} & =\frac{\sigma_{2}}{E}-\mu \frac{\sigma_{1}}{E} \\
\delta \mathrm{~L} / \mathrm{L} & =\frac{1}{E}\left(\sigma_{2}-\mu \sigma_{1}\right) \\
& =\frac{1}{2 \times 10^{5}}\left(62.5 \sigma_{2}-\mu 125\right) \\
& =12.5 \times 10^{-5}
\end{aligned}
$$

Increase in length

$$
\begin{aligned}
\delta \mathrm{L} & =12.5 \times 10^{-5} \times \mathrm{L} \\
& =12.5 \times 10^{-5} \times 500 \\
& =0.0625 \mathrm{~mm} .
\end{aligned}
$$

Volumetric strain is given as

$$
\begin{aligned}
\delta \mathrm{V} / \mathrm{V} & =2 \times \mathrm{e}_{1}+\mathrm{e}_{2} \\
& =2 \times 53.125 \times 10^{-5}+12.5 \times 10-5 \\
& =118.75 \times 10^{-5}
\end{aligned}
$$

Increase in volume

$$
\delta \mathrm{V}=118.75 \times 10^{-5} \times \mathrm{V}
$$

$$
\begin{aligned}
& =118.75 \times 10^{-5} \times \frac{\pi}{4} \times 250^{2} \times 500 \\
& =29.13 \times 10^{3} \mathrm{~mm}^{3}
\end{aligned}
$$

## Result :

Hoop stress and Longitudinal stress $\boldsymbol{\sigma}_{1}=\mathbf{1 2 5} \mathrm{N} / \mathrm{mm}^{2} ; \boldsymbol{\sigma}_{2}=\mathbf{6 2 . 5} \mathrm{N} / \mathrm{mm}^{2}$ Increase in length, diameter and volume $\boldsymbol{\delta L}=\mathbf{0 . 0 6 2 5} \mathbf{~ m m}$

$$
\begin{aligned}
\delta \mathrm{d} & =0.133 \mathrm{~mm} ; \\
\delta \mathrm{V} & =29.13 \times 10^{3} \mathrm{~mm}^{3}
\end{aligned}
$$

Problem 1.5.12: A cylindrical vessel is 1.5 m diameter and 4 m long is closed at ends by rigid plates. It is subjected to an internal pressure of $3 \mathrm{~N} / \mathrm{mm}^{2}$. If the maximum principal stress is not to exceed $150 \mathrm{~N} / \mathrm{mm}^{2}$, find the thickness of the shell. Assume $\mathrm{E}=2 \times 10^{5} \mathrm{~N} / \mathrm{mm}^{2}$ and poison's ratio $=0.25$ Find the changes in diameter, Length and volume of the shell.

## Given Data:

| Diameter | $d=1.5 \mathrm{~m}=1500 \mathrm{~mm}$ |
| :--- | :--- |
| Length | $L=4 m=4000 \mathrm{~mm}$ |
| Internal pressure | $\mathrm{p}=3 \mathrm{~N} / \mathrm{mm}^{2}$ |
| Max principal stress is as | $\sigma_{1}=150 \mathrm{~N} / \mathrm{mm}^{2}$ |
|  | $\mathrm{E}=2 \times 10^{5} \mathrm{~N} / \mathrm{mm}^{2}$ |
| poison's ratio | $\mu=0.25$ |

## To find:

Thickness of cylinder $\mathrm{t}=$ ?
Change in length, diameter and volume $=$ ?
(i) Using hoop stress equations $\quad \sigma_{1}=\frac{p d}{2 t}$

$$
\mathrm{t}=\frac{p d}{2 \times \sigma_{1}}=\frac{3 \times 1500}{2 \times 150}
$$

$$
=15 \mathrm{~mm}
$$

(ii) Change in diameter

$$
\begin{aligned}
\delta \mathrm{d} & =\frac{p d^{2}}{2 t E}\left(1-\frac{\mu}{2}\right) \\
& =\frac{3 \times 1500^{2}}{2 \times 15 \times 2 \times 10^{5}}\left(1-\frac{0.30}{2}\right)
\end{aligned}
$$

$$
=0.984 \mathrm{~mm}
$$

(iii) Change in length

$$
\begin{aligned}
\delta \mathrm{L} & =\frac{p d L}{2 t E}\left(\frac{1}{2}-\mu\right) \\
& =\frac{3 \times 1500 \times 4 \times 10^{3}}{2 \times 15 \times 2 \times 10^{5}}\left(\frac{1}{2}-0.30\right) \\
& =0.75 \mathrm{~mm}
\end{aligned}
$$

(iv) Change in volume $\quad \delta \mathrm{V} / \mathrm{V}=\frac{p d}{2 t E}\left(\frac{5}{2}-2 \mu\right)$

$$
\begin{aligned}
\delta \mathrm{V} & ={ }_{2 d}^{p d}\left({ }_{2}^{5}-2 \mu\right) V \\
& \left.=\frac{3 \times 1500}{2 \times 15 \times 2 \times 10^{5}}\left(\frac{5}{2}-2 \times 0.30\right) \times \frac{\pi}{4} \times 250^{2} \times 500\right] \\
& =10602875 \mathrm{~mm}^{3}
\end{aligned}
$$

## Result:

Thickness of cylinder

$$
t=15 \mathrm{~mm}
$$

Change in length, diameter and volume $\boldsymbol{\delta L} \mathbf{= 0 . 9 8 4} \mathbf{~ m m}$

$$
\begin{gathered}
\delta d=0.75 \mathrm{~mm} ; \\
\delta V=10602875 \mathrm{~mm}^{3}
\end{gathered}
$$

Problem 1.5.13: A cylindrical shell 3 m long which is closed as the ends has an internaldiameter of 1 m and a wall thickness of 15 mm . Calculate the circumferential andlongitudinal stresses induced and also changes in the dimensions of the shell, if it issubjected to an internal pressure of $1.5 \mathrm{~N} / \mathrm{mm}^{2}$. Take $\mathrm{E}=2 \times 10^{5}$ $\mathrm{N} / \mathrm{mm}^{2}$ and $\mu=0.3$ Given data:

| Length of shell | $L=3 m=3000 \mathrm{~mm}$ |
| :--- | :--- |
| Internal diameter | $d=1 \mathrm{~m}=1000 \mathrm{~mm}$ |
| Wall thickness | $t=15 \mathrm{~mm}$ |
| Internal pressure | $\mathrm{p}=1.5 \mathrm{~N} / \mathrm{mm}^{2}$ |
| Young's modulus | $\mathrm{E}=2 \times 10^{5} \mathrm{~N} / \mathrm{mm}^{2}$ |
| Poison's ratio | $\mu=0.3$ |

## To find:

Longitudinal stress and hoop stress $=$ ?
Increase in length, diameter and volume $=$ ?
soln:

$$
\begin{array}{ll}
\text { Using equation for hoop stress } & \sigma_{1}
\end{array}=\frac{p d}{2 t}=\frac{1.5 \times 1000}{2 \times 15}
$$

Change in dimensions
Using equation for the change in diameter ( $\delta \mathrm{d}$ )

$$
\begin{aligned}
\delta \mathrm{d} & ={\underset{2 \mathrm{tE}}{\mathrm{pd}^{2}}\left[1-{ }_{2}^{1} \times \mu\right]}_{2} \\
& ={ }_{2 \times 1.5 \times 2 \times 1000^{2}}^{1.5 \times 10^{5}}\left[\begin{array}{c}
1-{ }_{2}^{1} \times 0.3 \\
2
\end{array}\right] \\
& =0.2125 \times 10^{-2} \mathrm{~mm}
\end{aligned}
$$

Using equation for change in length we get

$$
\begin{aligned}
\delta \mathrm{L} & =\frac{p d L}{2 t E}\left(\begin{array}{l}
1 \\
2
\end{array}-\mu\right) \\
& =\begin{array}{c}
1.5 \times 1000^{2} \\
2 \times 1.5 \times 2 \times 10^{5}
\end{array}\left(\begin{array}{l}
1 \\
2
\end{array}-0.3\right) \\
& =0.15 \mathrm{~mm}
\end{aligned}
$$

Using volumetric strain equation we get,

$$
\begin{aligned}
\delta \mathrm{V} / \mathrm{V} & =\frac{p d}{2 t E}\left({ }_{2}^{5}-2 \mu\right) \\
\delta \mathrm{V} & =\frac{p d}{2 t E}\left({ }_{2}^{5}-2 \mu\right) V \\
& =\frac{1.5 \times 1000}{2 \times 1.5 \times 2 \times 10^{5}}\left(\frac{5}{2}-2 \times 0.30\right) \times\left[\frac{\pi}{4} \times 1000^{2} \times 3000\right] \\
& =1119190.85 \mathrm{~mm}^{3}
\end{aligned}
$$

## Result:

Hoop stress and Longitudinal stress $\boldsymbol{\sigma}_{\mathbf{1}}=\mathbf{5 0} \mathbf{N} / \mathbf{m m}^{2} ; \boldsymbol{\sigma}_{\mathbf{2}}=\mathbf{2 5} \mathbf{N} / \mathbf{m m}^{2}$
Change in length, diameter and volume $\boldsymbol{\delta L}=\mathbf{0} \mathbf{0 . 0 0 2 1 2 5 m m}$

$$
\begin{aligned}
\delta \mathrm{d} & =0.15 \mathrm{~mm} ; \\
\delta \mathrm{V} & =1119190.85 \mathrm{~mm}^{3}
\end{aligned}
$$

Problem 1.5.14: A thin cylindrical shell with following dimensions is filled with a liquid at atmospheric pressure Length $=1.2 \mathrm{~m}$ external diameter $=20 \mathrm{~cm}$, thickness of metal $=8 \mathrm{~mm}$.

Find the value of the pressure exerted by the liquid on the walls of the cylinder and the hoop stress induced if an additional volume of $25 \mathrm{~cm}^{3}$ of liquid is pumped into the cylinder. Take $\mathrm{E}=2.1 \times 10^{5} \mathrm{~N} / \mathrm{mm}^{2}$ and poison ratio $=0.33$

## Given data:

| Length | $L=1.2 \mathrm{~m}=1200 \mathrm{~mm}$ |
| :--- | :--- |
| External diameter | $\mathrm{D}=20 \mathrm{~cm}=200 \mathrm{~mm}$ |
| Thickness | $\mathrm{t}=8 \mathrm{~mm}$ |
| Internal diameter | $\mathrm{d}=\mathrm{D}-(2 \times \mathrm{t})=200-(2 \times 8)=184 \mathrm{~mm}$ |
| Additional Volume $\delta \mathrm{V}=25 \mathrm{~cm}^{3}=25 \times 10^{3} \mathrm{~mm}^{3}$ |  |

## To find:

Pressure exerted by the liquid on the walls $\mathrm{p}=$ ?
Hoop stress induced $\quad \sigma_{1}=$ ?

## solution:

Volume of liquid or inside volume of cylinder

$$
\begin{aligned}
\mathrm{V}={ }_{4}^{\pi} \times d^{2} \times \mathrm{L} & =\frac{\pi}{4} \times 184^{2} \times 1200 \\
& =31908528 \mathrm{~mm}^{3}
\end{aligned}
$$

Using volumetric strain equation we get,

$$
\begin{aligned}
\delta \mathrm{V} / \mathrm{V} & ={ }_{2 t d^{p d}\left(c_{2}^{5}-2 \mu\right)}^{25000} \\
\frac{25000}{31908528} & =\underset{2 \times 8 \times 2.1 \times 10^{5}}{\mathrm{p} \times 184}\left(\begin{array}{l}
5 \\
2
\end{array}-2 \times 0.33\right) \\
\mathrm{p} & =\underset{31908528 \times 184 \times(2.5-0.66)}{2500 \times 2 \times 8 \times 2.1 \times 10^{5}}=7.77 \mathrm{~N} / \mathrm{mm}^{2}
\end{aligned}
$$

Using Circumferential stress equations

$$
\sigma_{1}=\frac{p d}{2 t}=\frac{7.77 \times 184}{2 \times 8}=89.42 \mathrm{~N} / \mathrm{mm}^{2}
$$

## Result:

Pressure exerted by the liquid on the walls $p=7.77 \mathrm{~N} / \mathrm{mm}^{2}$
Hoop stress induced

$$
\sigma_{1}=89.42 \mathrm{~N} / \mathrm{mm}^{2}
$$

Problem 1.5.15: A hallow cylindrical drum 600 mm in diameter and 3 m long, has a shell thickness of 10 mm . If the drum is subjected to an internal air pressure of 3 $\mathrm{N} / \mathrm{mm}^{2}$, determine the increases in its volumes. Take $\mathrm{E}=2 \times 10^{5} \mathrm{~N} / \mathrm{mm}^{2}$ and poisons ratio $=0.3$ for the material .

## Given data:

| External diameter | $D=600 \mathrm{~mm}$ |
| :--- | :--- |
| Length of drum | $L=3 \mathrm{~m}=3000 \mathrm{~mm}$ |
| Thickness of drum | $t=10 \mathrm{~mm}$ |
| Internal pressure | $p=3 \mathrm{~N} / \mathrm{mm}^{2}$ |
| Young's modulus | $E=2 \times 10^{5} \mathrm{~N} / \mathrm{mm}^{2}$ |
| Poison's ratio | $\mu=0.3$ |

## To find:

Increases in volumes $\delta \mathrm{V}=$ ?

## Solution:

$$
\text { Internal diameter } \begin{aligned}
\mathrm{d} & =\mathrm{D}-(2 \times \mathrm{t})=600-(2 \times 10) \\
& =580 \mathrm{~mm}
\end{aligned}
$$

Using volumetric strain equation we get,

$$
\begin{aligned}
& \delta \mathrm{V} / \mathrm{V}={ }_{2 t E}^{p d}\left({ }_{2}^{5}-2 \mu\right) \\
& \delta \mathrm{V}={ }_{2 t E}^{p d}\left({ }_{2}^{5}-2 \mu\right) \mathrm{V} \quad\left[\because V={ }_{4}^{\pi} \times d^{2} \times \mathrm{L}\right] \\
& \left.=\underset{2 \times 10 \times 2 \times 10^{5}}{3 \times 580}\left({ }_{2}^{5}-2 \times 0.3\right) \times{ }_{4}^{\pi} \times 580^{2} \times 3000\right] \\
& =792623000 \mathrm{~mm}^{3}
\end{aligned}
$$

## Result:

Increases in volumes $\boldsymbol{\delta V}=\mathbf{7 9 2 6 2 3 0 0 0} \mathbf{~ m m}^{\mathbf{3}}$
