DEPARTMENT OF MATHEMATICS

**NAME OF THE SUBJECT : TRANSFORMS & PARTIAL
DIFFERENTIAL
EQUATION**

SUBJECT CODE : MA8353

REGULATION : 2017

UNIT - I : PARTIAL DIFFERENTIAL EQUATION

UNIT I - PARTIAL DIFFERENTIAL EQUATIONS

Notations: If $z = f(x, y)$ then

$$p = \frac{\partial z}{\partial x}; q = \frac{\partial z}{\partial y}; r = \frac{\partial^2 z}{\partial x^2}; s = \frac{\partial^2 z}{\partial x \partial y}; t = \frac{\partial^2 z}{\partial y^2}$$

Formation of PDE by eliminating arbitrary constants:

Let the given equation be $z = f(x, y, a, b) \quad \dots \dots \dots (1)$

Step 1: Differentiating (1) partially with respect to x

$$\frac{\partial z}{\partial x} = p = f'(x, y, a, b) \quad \dots \dots \dots (2)$$

Step 2: Differentiating (1) partially with respect to y

$$\frac{\partial z}{\partial y} = q = f'(x, y, a, b) \quad \dots \dots \dots (3)$$

Step 3: Eliminate a & b from (1) using (2) & (3)

1. **Obtain partial differential equation by eliminating arbitrary constant 'a' and 'b' from**

$$z = (x - a)^2 + (y - b)^2$$

Solution:

$$\text{Given } z = (x - a)^2 + (y - b)^2 \quad \dots \dots \dots (1)$$

Diff Partially w.r.t x

$$\frac{\partial z}{\partial x} = 2(x - a) + 0$$

$$p = 2(x - a) \quad \dots \dots \dots (2)$$

Diff Partially w.r.t y

$$\frac{\partial z}{\partial y} = 0 + 2(y - b)$$

$$q = 2(y - b) \quad \dots \dots \dots (3)$$

Eliminate a & b from (1) using (2) & (3)

$$(2) \Rightarrow (x - a) = \frac{p}{2} \quad \dots \dots \dots (4)$$

$$(3) \Rightarrow y - b = \frac{q}{2} \quad \dots \dots \dots (5)$$

Sub (4) & (5) in (1)

$$(1) \Rightarrow z = \left(\frac{p}{2}\right)^2 + \left(\frac{q}{2}\right)^2$$

The required the PDE is

$$p^2 + q^2 = 4z$$

2. **Form the partial differential equation by eliminating the arbitrary constants 'a' & 'b' from**

$$z = (x^2 + a)(y^2 + b).$$

Solution:

$$\text{Given } z = (x^2 + a)(y^2 + b) \quad \dots \dots \dots (1)$$

Diff Partially w.r.t x

$$\frac{\partial z}{\partial x} = p = 2x(y^2 + b) \quad \dots \dots \dots (2)$$

Diff Partially w.r.t y

$$\frac{\partial z}{\partial y} = q = 2y(x^2 + a) \quad \dots \dots \dots (3)$$

Eliminate a & b from (1) using (2) & (3)

$$(2) \Rightarrow (y^2 + b) = \frac{p}{2x} \quad \dots \dots (4)$$

$$(3) \Rightarrow x^2 + b = \frac{q}{2y} \quad \dots \dots (5)$$

Sub (4) & (5) in (1)

$$(1) \Rightarrow z = \left(\frac{p}{2x} \right) \left(\frac{q}{2y} \right)$$

The required PDE is

$$4xyz = pq$$

3. **Find the PDE of all planes having equal intercepts on the x and y axis.**

Solution:

The intercept form of the plane equation is $\frac{x}{a} + \frac{y}{b} + \frac{z}{c} = 1$

Given that equal intercepts on the x & y axis $\Rightarrow a = b$

$$\therefore \frac{x}{a} + \frac{y}{a} + \frac{z}{c} = 1 \quad \dots \dots (1)$$

Diff Partially w.r.t x

$$\frac{1}{a} + 0 + \frac{1}{c} \frac{\partial z}{\partial x} = 0 \Rightarrow \frac{1}{a} = \frac{-1}{c} p \quad \dots \dots (2)$$

Diff Partially w.r.t y

$$0 + \frac{1}{a} (1) + \frac{1}{c} \frac{\partial z}{\partial y} = 0 \Rightarrow \frac{1}{a} = \frac{-1}{c} q \quad \dots \dots (3)$$

From (2) & (3) $\frac{-1}{c} p = \frac{-1}{c} q$ The required PDE is $p = q$

4. **Obtain the partial differential equation by eliminating arbitrary constants 'a' and 'b' from**

$$(x-a)^2 + (y-b)^2 + z^2 = r^2$$

Solution:

$$(x-a)^2 + (y-b)^2 + z^2 = 1 \quad \dots \dots (1) \quad - (1)$$

Diff Partially w.r.t x

$$2(x-a)(1-0) + 0 + 2z \frac{\partial z}{\partial x} = 0$$

$$\Rightarrow 2(x-a) + 2zp = 0 \quad \dots \dots (2)$$

Diff Partially w.r.t y

$$0 + 2(y-b)(1-0) + 2z \frac{\partial z}{\partial y} = 0$$

$$\Rightarrow 2(y-b) + 2zq = 0 \quad \dots \dots (3)$$

Eliminate a & b from (1) using (2) & (3)

$$(2) \Rightarrow x-a = -zp \quad \dots \dots (4)$$

$$(3) \Rightarrow y-b = -zq \quad \dots \dots (5)$$

Sub (4) & (5) in (1)

$$(-zp)^2 + (-zq)^2 + z^2 = 1$$

The required PDE is $z^2(p^2 + q^2 + 1) = 1$

Formation of PDE by eliminating arbitrary functions:

1. **Eliminate the arbitrary function f from $z = f\left(\frac{y}{x}\right)$ and form the PDE.**

Solution:

	$z = f\left(\frac{y}{x}\right) \quad \dots \dots \dots (1)$ <p>Diff Partially w.r.t x</p> $\frac{\partial z}{\partial x} = p = f'\left(\frac{y}{x}\right) \times \left(\frac{-y}{x^2}\right) \Rightarrow f'\left(\frac{y}{x}\right) = \frac{-px^2}{y} \quad \dots \dots \dots (2)$ <p>Diff Partially w.r.t y</p> $\frac{\partial z}{\partial y} = q = f'\left(\frac{y}{x}\right) \times \left(\frac{1}{x}\right) \quad \dots \dots \dots (3)$ <p>From (1) & (2) $\frac{p}{q} = \frac{-y}{x} \Rightarrow [px + qy = 0]$</p>
--	---

2.	<p>Form the partial differential equation by eliminating f from $z = x^2 + 2f\left(\frac{1}{y} + \log x\right)$.</p> <p>Solution:</p> <p>Given $z = x^2 + 2f\left(\frac{1}{y} + \log x\right) \quad \dots \dots \dots (1)$</p> <p>Differentiate (1) partially w.r.t x</p> $\frac{\partial z}{\partial x} = 2x + 2f'\left(\frac{1}{y} + \log x\right)\left(0 + \frac{1}{x}\right)$ $p = 2x + 2f'\left(\frac{1}{y} + \log x\right)\left(\frac{1}{x}\right) \Rightarrow f'\left(\frac{1}{y} + \log x\right) = (p - 2x)\frac{x}{2} \quad \dots \dots \dots (2)$ $\frac{\partial z}{\partial y} = 2f'\left(\frac{1}{y} + \log x\right)\left(\frac{-1}{y^2} + 0\right)$ $q = \frac{-2}{y^2}f'\left(\frac{1}{y} + \log x\right) \Rightarrow f'\left(\frac{1}{y} + \log x\right) = \frac{-qy^2}{2} \quad \dots \dots \dots (3)$ <p>Eliminating f' from (2) & (3)</p> $(p - 2x)\frac{x}{2} = \frac{-qy^2}{2} \Rightarrow (px - 2x^2) = -qy^2$ $\Rightarrow [px + qy^2 = 2x^2]$

Formation of PDE by eliminating f from $f(u, v) = 0$ ----- (1)

Method 1:

$$\text{The required PDE of (1) is } \begin{vmatrix} p & q & -1 \\ u_x & u_y & u_z \\ v_x & v_y & v_z \end{vmatrix} = 0$$

Method 2:

The required PDE is $Pp + Qq = R$

Where

$$P = \begin{vmatrix} u_y & v_y \\ u_z & v_z \end{vmatrix}; Q = \begin{vmatrix} u_z & v_z \\ u_x & v_x \end{vmatrix}; R = \begin{vmatrix} u_x & v_x \\ u_y & v_y \end{vmatrix}$$

1.	Form the PDE from $\phi(ax + by + cz, x^2 + y^2 + z^2) = 0$
----	---

Solution:

$$\text{Given } \phi(ax + by + cz, x^2 + y^2 + z^2) = 0$$

This is of the form $f(u, v) = 0$ where $u = ax + by + cz$ & $v = x^2 + y^2 + z^2$

	<p>The required PDE of (1) is $\begin{vmatrix} p & q & -1 \\ u_x & u_y & u_z \\ v_x & v_y & v_z \end{vmatrix} = 0$</p> $\begin{vmatrix} p & q & -1 \\ a & b & c \\ 2x & 2y & 2z \end{vmatrix} = 0$ $\Rightarrow p(2bz - 2cy) - q(2az - 2cx) + 1(2az - 2cx) = 0$ $\div 2 \Rightarrow (bz - cy)p + (cx - az)q + (az - cx) = 0$
2.	<p>Form the PDE from $\phi(x^2 + y^2 + z^2, xyz) = 0$</p> <p>Solution:</p> <p>Given $\phi(x^2 + y^2 + z^2, xyz) = 0$</p> <p>This is of the form $f(u, v) = 0$ where $u = x^2 + y^2 + z^2$ & $v = xyz$</p> <p>The required PDE of (1) is $\begin{vmatrix} p & q & -1 \\ u_x & u_y & u_z \\ v_x & v_y & v_z \end{vmatrix} = 0$</p> $\begin{vmatrix} p & q & -1 \\ 2x & 2y & 2z \\ yz & xz & xy \end{vmatrix} = 0$ $\Rightarrow p(2xy^2 - 2xz^2) - q(2x^2y - 2yz^2) + 1(2x^2z - 2y^2z) = 0$ $\div 2 \Rightarrow x(y^2 - z^2)p + y(z^2 - x^2) + z(x^2 - y^2) = 0$
3.	<p>Form the PDE from $\phi\left(\frac{y}{x}, x^2 + y^2 + z^2\right) = 0$</p> <p>Solution:</p> <p>Given $\phi\left(\frac{y}{x}, x^2 + y^2 + z^2\right) = 0$</p> <p>This is of the form $f(u, v) = 0$ where $u = \frac{y}{x}$ & $v = x^2 + y^2 + z^2$</p> <p>The required PDE of (1) is $\begin{vmatrix} p & q & -1 \\ u_x & u_y & u_z \\ v_x & v_y & v_z \end{vmatrix} = 0$</p> $\begin{vmatrix} p & q & -1 \\ \frac{-y}{x^2} & \frac{1}{x} & 0 \\ 2x & 2y & 2z \end{vmatrix} = 0$ $\Rightarrow p\left(\frac{2z}{x} - 0\right) - q\left(\frac{-2yz}{x^2} - 0\right) + 1\left(\frac{-2y^2}{x^2} - \frac{2x}{x}\right) = 0$ $\Rightarrow \frac{2zp}{x} + \frac{2yzq}{x^2} - 2\left(\frac{y^2}{x^2} + 1\right) = 0$ $\div 2 \Rightarrow \frac{zp}{x} + \frac{yzq}{x^2} - \left(\frac{y^2 + x^2}{x^2}\right) = 0$

$$\Rightarrow \frac{xzp + yzq - (y^2 + x^2)}{x^2} = 0$$

$$xzp + yzq - (y^2 + x^2) = 0$$

Solutions of standard types of First order PDE's:

Different solutions of PDE:

Complete Integral (or) Complete Solution:

If the number of arbitrary constants is equal to number of independent variables, then the solution is called Complete integral.

Singular Integral (or) Singular Solution:

Consider a PDE of first order as $f(x, y, z, p, q) = 0$ ----- (1)

It's complete integral may be, $f(x, y, z, a, b) = 0$ ----- (2)

Diff (2) partially with respect to a & b respectively,

$$\frac{\partial g}{\partial a} = 0 \quad \text{----- (3)}$$

$$\frac{\partial g}{\partial b} = 0 \quad \text{----- (4)}$$

Eliminating a & b from (3) & (4) will get the Singular integral.

General Integral (or) Complete solution:

A Solution which contains number of arbitrary functions is equal to the order of the given PDE.

(or) A solution which contains the maximum possible number of arbitrary functions.

Type I:

Equations of the form $f(p, q) = 0$ ----- (1)

To find Complete Integral:

Let the complete solution of (1) is $z = ax + by + c$ ----- (2)

Let $p = a$ & $q = b$ in (1)

$f(a, b) = 0$ and represent $b = \phi(a)$

$$\therefore (1) \Rightarrow z = ax + \phi(a)y + c \quad \text{-----(3)}$$

To Find Singular Integral:

Diff (3) partially with respect to c

$0 = 1$ which is impossible

There is no singular integral for this type.

To find General integral:

Put $c = g(a)$ in (3)

$$(3) \Rightarrow z = ax + \phi(a)y + g(a) \quad \text{-----(4)}$$

Diff (4) partially with respect to a

$$0 = x(1) + \phi'(a)y + g'(a) \quad \text{-----(5)}$$

Eliminating a from (4) & (5) we get general integral.

1. **Find the complete integral of $p + q = pq$**

Solution:

Given $p + q = pq$ ----- (1)

This of the form $f(p, q) = 0$

To find Complete Integral:

Let the complete solution of (1) is $z = ax + by + c$ ----- (2)

Let $p = a$ & $q = b$ in (1)

$$(1) \Rightarrow a + b = ab \Rightarrow a + b - ab = 0 \Rightarrow b = \frac{a}{a-1}$$

Sub b in (2)

$$z = ax + \left(\frac{a}{a-1} \right) y + c$$

This is the required complete integral.

2.	<p>Find the complete integral of $p + q = 1$</p> <p>Solution:</p> <p>Given $p + q = 1 \dots\dots(1)$</p> <p>This of the form $f(p, q) = 0$</p> <p>To find Complete Integral:</p> <p>Let the complete solution of (1) is $z = ax + by + c \dots\dots(2)$</p> <p>Let $p = a$ & $q = b$ in (1)</p> <p>(1) $\Rightarrow a + b = 1 \Rightarrow b = 1 - a$</p> <p>Sub b in (2)</p> <div style="border: 1px solid black; padding: 2px; display: inline-block;"> $z = ax + (1 - a)y + c$ </div> <p>This is the required complete integral.</p>

$$0 = x(1) + \phi'(a)y + g'(a) \quad \dots \dots \dots (6)$$

Eliminating a from (5) & (6) we get General integral.

1. Solve $z = px + qy + p^2q^2$

Solution:

Given $z = px + qy + p^2q^2 \quad \dots \dots \dots (1)$

Equations of the form $z = px + qy + f(p, q)$

To find Complete Integral:

Put $p = a$ & $q = b$ in (1)

$$\therefore (1) \Rightarrow z = ax + by + a^2b^2 \quad \dots \dots \dots (2)$$

This is the required complete integral

To Find Singular Integral:

Diff (2) partially with respect to a

$$0 = x(1) + 0 + 2ab^2 \Rightarrow x + 2ab^2 = 0 \Rightarrow x = -2ab^2 \quad \dots \dots \dots (3)$$

Diff (2) partially with respect to b

Sub (5), a & b in (2)

$$(2) \Rightarrow z = \left(\frac{-x}{\sqrt{1 - x^2 - y^2}} \right)x + \left(\frac{-y}{\sqrt{1 - x^2 - y^2}} \right)y + \frac{1}{\sqrt{1 - x^2 - y^2}}$$

$$\Rightarrow z = \frac{-x^2}{\sqrt{1 - x^2 - y^2}} + \frac{-y^2}{\sqrt{1 - x^2 - y^2}} + \frac{1}{\sqrt{1 - x^2 - y^2}}$$

$$\Rightarrow z = \frac{1 - x^2 - y^2}{\sqrt{1 - x^2 - y^2}}$$

$$\Rightarrow z = \sqrt{1 - x^2 - y^2}$$

Squaring on both sides

$$z^2 = 1 - x^2 - y^2 \Rightarrow \boxed{x^2 + y^2 + z^2 = 1}$$

4. **Find the singular integral of $z = px + qy + p^2 - q^2$**

Solution:

$$\text{Given } z = px + qy + p^2 - q^2 \quad \text{---(1)}$$

Equations of the form $z = px + qy + f(p, q)$

To find Complete Integral:

Put $p = a$ & $q = b$ in (1)

$$\therefore (1) \Rightarrow z = ax + by + a^2 - b^2 \quad \dots \dots \dots (2)$$

This is the required complete integral

To Find Singular Integral:

Diff (2) partially with respect to a

$$0 = x(1) + 0 + 2a + 0 \Rightarrow a = \frac{-x}{2} \quad \dots \dots \dots (3)$$

Diff (2) partially with respect to b

$$0 = 0 + y(1) + 0 - 2b \Rightarrow b = \frac{y}{2} \quad \dots \dots \dots (4)$$

Sub a & b in (2)

$$\therefore (2) \Rightarrow z = \left(\frac{-x}{2}\right)x + \left(\frac{y}{2}\right)y + \left(\frac{-x}{2}\right)^2 - \left(\frac{y}{2}\right)^2$$

$$\therefore (2) \Rightarrow z = \frac{-x^2}{2} + \frac{y^2}{2} + \frac{x^2}{4} - \frac{y^2}{4}$$

$$\therefore (2) \Rightarrow z = \frac{-2x^2 + 2y^2 + x^2 - y^2}{4} \Rightarrow [4z = -x^2 + y^2]$$

This is the required singular integral.

Type III:

Equations of the form $f(z, p, q) = 0 \quad \dots \dots \dots (1)$

In this type x & y do not appear explicitly.

To find Complete Integral:

Let the complete solution of (1) is $z = f(x + ay) \quad \dots \dots \dots (2)$

Let $x + ay = u$

$$(2) \Rightarrow z = f(u) \quad \dots \dots \dots (3)$$

By total derivative,

$$\frac{\partial z}{\partial x} = \frac{dz}{du} \cdot \frac{\partial u}{\partial x} \Rightarrow p = \frac{dz}{dx} \quad (1) \quad \because u = x + ay \Rightarrow \frac{\partial u}{\partial x} = 1$$

$$\frac{\partial z}{\partial y} = \frac{dz}{du} \cdot \frac{\partial u}{\partial y} \Rightarrow q = a \frac{dz}{du} \quad \because u = x + ay \Rightarrow \frac{\partial u}{\partial y} = a$$

Substitute the value of p & q in (1)

$$(1) \Rightarrow f\left(z, \frac{dz}{du}, a \frac{dz}{du}\right) = 0$$

This may be solve by method of separation of variables

Other solutions can obtain as usual.

1. Solve $p(1+q) = qz$.

Solution:

$$\text{Given } p(1+q) = qz \quad \dots \dots \dots (1)$$

This is of the form $f(z, p, q) = 0$

To find Complete Integral:

Let the complete solution of (1) is $z = f(x + ay) \quad \dots \dots \dots (2)$

Let $x + ay = u \Rightarrow z = f(u)$

$$\text{Then } p = \frac{dz}{du} \quad \& \quad q = a \frac{dz}{du}$$

Substitute the value of p & q in (1)

$$(1) \Rightarrow \frac{dz}{du} \left(1 + a \frac{dz}{du}\right) = a \frac{dz}{du} z$$

$$1 + a \frac{dz}{du} = az$$

$$\frac{dz}{du} = az - 1$$

$$\frac{dz}{az - 1} = du$$

Integrating on both sides

$$\int \frac{dz}{az - 1} = \int du$$

$$u = \log(az - 1) + c \quad \therefore \int \frac{f'(x)}{f(x)} dx = \log f(x)$$

$$x + ay = \log(az - 1) + c$$

This is the required complete integral.

Other solutions can be obtained as usual.

2. Solve $z^2 = 1 + p^2 + q^2$

Solution:

$$\text{Given } z^2 = 1 + p^2 + q^2 \quad \dots \dots \dots (1)$$

This is of the form $f(z, p, q) = 0$

To find Complete Integral:

Let the complete solution of (1) is $z = f(x + ay) \quad \dots \dots \dots (2)$

$$\text{Let } x + ay = u \Rightarrow z = f(u)$$

$$\text{Then } p = \frac{dz}{du} \quad \& \quad q = a \frac{dz}{du}$$

Substitute the value of p & q in (1)

$$(1) \Rightarrow z^2 = \left(\frac{dz}{du} \right)^2 + \left(a \frac{dz}{du} \right)^2 + 1$$

$$\Rightarrow \left(\frac{dz}{du} \right)^2 + a^2 \left(\frac{dz}{du} \right)^2 = z^2 - 1$$

$$\Rightarrow (1 + a^2) \left(\frac{dz}{du} \right)^2 = z^2 - 1$$

$$\Rightarrow \left(\frac{dz}{du} \right)^2 = \frac{z^2 - 1}{1 + a^2}$$

Taking square root on both sides

$$\frac{dz}{du} = \frac{\sqrt{z^2 - 1}}{\sqrt{1 + a^2}}$$

$$\Rightarrow \frac{dz}{\sqrt{z^2 - 1}} = \frac{du}{\sqrt{1 + a^2}}$$

Integrating on both sides

$$\cosh^{-1} z = \frac{1}{\sqrt{a^2 - 1}} u + c \quad \therefore \int \frac{dz}{\sqrt{x^2 - 1}} = \cosh^{-1} x$$

$$\cosh^{-1} z = \frac{1}{\sqrt{a^2 - 1}} (x + ay) + c \quad \because u = x + ay$$

This is the required complete integral.

Other solutions can be obtained as usual.

Lagrange's Linear Differential Equations:	
Equations of the form $Pp + Qq = R$ (or) $P \frac{\partial z}{\partial x} + Q \frac{\partial z}{\partial y} = R$	
Where P, Q, R are functions of x, y, z or constants.	
Procedure :	
1. Write the auxiliary equation $\frac{dx}{P} = \frac{dy}{Q} = \frac{dz}{R}$	
2. Solve the auxiliary equation by using a) Method of grouping b) Method of multipliers	
a) Method of grouping: In the auxiliary equation, if the variables can be separated in any pair of equations, then we get a solution of the form $u(x, y, z) = c_1$ & $v(x, y, z) = c_2$	
\therefore The general solution is $\phi(u, v) = 0$	
b) Method of Multipliers:	
i) Choose any three multipliers l, m, n which may be constants or functions of x, y, z we have	
$\frac{dx}{P} = \frac{dy}{Q} = \frac{dz}{R} = \frac{l dx + m dy + n dz}{l P + m Q + n R}$	
If it is possible to choose l, m, n such that $l P + m Q + n R = 0$ then $l dx + m dy + n dz = 0$	
Integrating this we get $u(x, y, z) = c_1$	
ii) Choose another any three multipliers l', m', n' which may be constants or functions of x, y, z we have	
$\frac{dx}{P} = \frac{dy}{Q} = \frac{dz}{R} = \frac{l' dx + m' dy + n' dz}{l' P + m' Q + n' R}$	
If it is possible to choose l', m', n' such that $l' P + m' Q + n' R = 0$ then $l' dx + m' dy + n' dz = 0$	
Integrating this we get $v(x, y, z) = c_2$	
\therefore The general solution is $\phi(u, v) = 0$

$$\therefore dx + dy + dz = 0$$

$$\text{Integrating } \int dx + \int dy + \int dz = 0$$

$$x + y + z = c_1$$

ii) Choose the multipliers as $\left(\frac{1}{x}, \frac{1}{y}, \frac{1}{z}\right)$

Homogeneous Linear PDE of second and higher order with constant co-efficient:

Consider the second order homogeneous linear PDE

$$\frac{\partial^2 z}{\partial x^2} + a_1 \frac{\partial^2 z}{\partial x \partial y} + a_2 \frac{\partial^2 z}{\partial y^2} = f(x, y) \quad \text{--- (1)}$$

Let the differential operator $D = \frac{\partial}{\partial x}$ & $D' = \frac{\partial}{\partial y}$

$$(1) \Rightarrow (D^2 + a_1 DD' + a_2 D'^2)z = f(x, y) \quad \text{--- (2)}$$

The general solution of equation (2) is

$$\boxed{z = \text{complementary function} + \text{Particular Integral} = C.F + P.I}$$

To find complementary Function:

1. Write the Auxiliary equation by putting $D = m, D' = 1, z = 1, \& RHS = 0$

$$(2) \Rightarrow m^2 + a_1m + a_2 = 0$$

2. Solve the auxiliary equation, we get the roots of m . Say the roots are m_1, m_2

3. Comparing the roots of m and write the complementary function.

Case 1: The Roots are real and distinct : say $m_1 \neq m_2$

$$C.F = f_1(y + m_1x) + f_2(y + m_2x)$$

Case 2: The Roots are real and equal : say $m_1 = m_2 = m$

$$C.F = f_1(y + mx) + xf_2(y + mx)$$

Note: If the roots are $m = \alpha \pm i\beta$

$$\text{then } C.F = f_1[y + (\alpha + i\beta)] + f_2[y + (\alpha - i\beta)]$$

To find Particular Integral :**Type : I**

If $RHS = e^{ax+by}$ then

$$P.I = \frac{1}{f(D, D')} e^{ax+by}$$

$$\text{Rule: } D = a \& D' = b$$

$$P.I = \frac{1}{f(a, b)} e^{ax+by}, \text{ Provided Denominator} \neq 0$$

If Denominator = 0, then 1) multiply the numerator by x 2) differentiating denominator partially w.r.to D

$$P.I = \frac{x}{f'(D, D')} e^{ax+by}$$

$$P.I = \frac{1}{f'(a, b)} e^{ax+by}, \text{ Provided Denominator} \neq 0 \because \text{Replace } D = a \& D' = b$$

Continuing this process until we get $Dr \neq 0$.

Type : II

If $RHS = \sin(ax+by)$ (or) $RHS = \cos(ax+by)$ then

$$P.I = \frac{1}{f(D^2, DD', D'^2)} \sin(ax+by)$$

$$\text{Rule: } D^2 = -(a^2); DD' = (-ab); D'^2 = -(b^2)$$

$$P.I = \frac{1}{f(-a^2, -ab, -b^2)} \sin(ax+by), \text{ Provided Dr} \neq 0$$

Note 1: After substitutions the denominator will be in terms of D & D' . Multiply and divide by D so that the denominator will have D^2 & DD' terms.

Note 2: After substitutions the denominator will be in terms of D & constant terms,

$$\text{For eg. } P.I = \frac{1}{D-5} \sin(x-2y)$$

Take conjugate of denominator with constant term and multiplied with both numerator and denominator.

$$P.I = \frac{1}{D-5} \times \frac{D+5}{D+5} \sin(x-2y) = \frac{1}{D^2-25} \sin(x-2y)$$

Then apply the rule as usual.

Type : III

If $RHS = x^m y^n$ (polynomial type) then

$P.I = \frac{1}{f(D, D')} x^m y^n$, we bring this into a standard binomial format, by taking out highest power term of D.

$$(i.e) P.I = [1 \pm f(D, D')]^{-1} x^m y^n$$

This will be expanded by using the formulae

$$(1-x)^{-1} = 1 + x + x^2 + x^3 + \dots$$

$$(1+x)^{-1} = 1 - x + x^2 - x^3 + \dots$$

$$(1-x)^{-2} = 1 + 2x + 3x^2 + 4x^3 + \dots$$

$$(1+x)^{-2} = 1 - 2x + 3x^2 - 4x^3 + \dots$$

Note:

$$\frac{1}{D} = \int dx, D' = \frac{\partial}{\partial y}$$

Type : IV (Exponential shifted rule)

If $\boxed{RHS = e^{ax+by} \cos(ax+by)}$ (or) $\boxed{RHS = e^{ax+by} \sin(ax+by)}$ (or) $\boxed{RHS = e^{ax+by} x^m y^n}$ then

$$P.I = \frac{1}{f(D, D')} e^{ax+by} \sin(ax+by)$$

$$P.I = e^{ax+by} \frac{1}{f(D+a, D'+b)} \sin(ax+by)$$

Here after apply the rule as we discussed in Type II&III

Type : V

If $\boxed{RHS = y \cos x}$ (or) $\boxed{RHS = y \sin x}$ then

Case 1:

$$P.I = \frac{1}{D - mD'} y \cos x$$

$$P.I = \frac{1}{D - mD'} \int (c - mx) \cos x dx \quad \because \text{Rule: } \boxed{y = c - mx}$$

Case 2:

$$P.I = \frac{1}{D + mD'} y \cos x$$

$$P.I = \frac{1}{D + mD'} \int (c + mx) \cos x dx \quad \because \text{Rule: } y = c - mx$$

Note: After integration we have to replace $c - mx = y$

1. Solve $(D^2 - DD' - 20D'^2)z = e^{5x+y} + \sin(4x-y)$

To find P.I

$$P.I = \frac{1}{D^2 - DD' - 20D'^2} [e^{5x+y} + \sin(4x-y)]$$

$$(1) \Rightarrow (D^2 + a_1 DD' + a_2 D'^2 + a_3 D + a_4 D')z = f(x, y) \quad \text{--- (2)}$$

The general solution of equation (2) is

$$z = \text{complementary function} + \text{Particular Integral} = C.F + P.I$$

To find complementary Function:

Case : I

The given PDE will bring into the form of $(D - m_1 D' - C_1)(D - m_2 D' - C_2)z = 0$

$$C.F = e^{c_1 x} f_1(y + m_1 x) + e^{c_2 x} f_2(y + m_2 x)$$

Case : II

$$P.I_2 = \frac{1}{181} [9 \sin(x + 2y) - 10 \cos(x + 2y)]$$

$$P.I = \frac{1}{8} e^{3x+y} + \frac{1}{181} [9 \sin(x + 2y) - 10 \cos(x + 2y)]$$

The general solution is

$$z = C.F + P.I$$

$$z = f_1(y - x) + e^{2x} f_2(y - x) + \frac{1}{8} e^{3x+y} + \frac{1}{181} [9 \sin(x + 2y) - 10 \cos(x + 2y)]$$

2. Solve $(D^2 - D'^2 - 3D + 3D')z = e^{3x+y} + 4$

Solution:

$$\text{Given } (D^2 - D'^2 - 3D + 3D')z = e^{3x+y} + 4$$

To find C.F

$$((D + D')(D - D') - 3(D - D'))z = 0$$

$$(D - D')(D + D' - 3)z = 0 \quad \dots \dots \dots (1)$$

This is of the form

$$(D - m_1 D' - C_1)(D - m_2 D' - C_2)z = 0 \quad \dots \dots \dots (2)$$

Comparing (1) & (2)

$$= \frac{4x}{-3}$$

$$P.I_2 = \frac{-4x}{3}$$

$$P.I = \frac{1}{2} e^{3x+y} - \frac{4x}{3}$$

The general solution is

$$z = C.F + P.I$$

$$z = f_1(y+x) + e^{3x} f_2(y-x) + \frac{1}{2} e^{3x+y} - \frac{4x}{3}$$

3. Solve $(2D^2 - DD' - D'^2 + 6D + 3D')z = xe^y$

Solution:

$$\text{Given } (2D^2 - DD' - D'^2 + 6D + 3D')z = xe^y$$

To find C.F

$$(2D^2 - DD' - D'^2 + 6D + 3D')z = 0$$

$$(2D + D')(D - D') + 3(2D + D')z = 0$$

$$(2D + D')(D - D' + 3)z = 0$$

$$\left(D + \frac{D'}{2}\right)(D - D' + 3)z = 0$$

This is of the form

$$(D - m_1 D' - C_1)(D - m_2 D' - C_2)z = 0 \quad \dots \dots \dots (2)$$

Comparing (1) & (2)

$$m_1 = \frac{-1}{2}, C_1 = 0, m_2 = 1, C_2 = -3.$$

$$C.F = e^{c_1 x} f_1(y + m_1 x) + e^{c_2 x} f_2(y + m_2 x)$$

$$C.F = f_1\left(y - \frac{x}{2}\right) + e^{-3x} f_2(y+x) \quad \because e^0 = 1$$

To find P.I

$$P.I = \frac{1}{2D^2 - DD' - D'^2 + 6D + 3D'} xe^y \quad \text{Type : 4}$$

$$P.I = \frac{1}{2D^2 - DD' - D'^2 + 6D + 3D'} xe^{0x+y} \quad \text{here } a = 0, b = 1$$

Rule: replace $D = D + a = D + 0 = D$; $D' = D' + b = D' + 1$

$$\begin{aligned} P.I &= e^{0x+y} \frac{1}{2D^2 - D(D'+1) - (D'+1)^2 + 6D + 3(D'+1)} x \\ &= e^y \frac{1}{2D^2 - DD' - D - D'^2 - 2D' - 1 + 6D + 3D' + 3} x \quad \text{Type : 3} \\ &= e^y \frac{1}{2D^2 - DD' + 5D - D'^2 + D' + 2} x \\ &= e^y \frac{1}{2 \left[1 + \left(\frac{2D^2 - DD' + 5D - D'^2 + D'}{2} \right) \right]} x \end{aligned}$$

[normally we take out highest power term of D in the homogeneous type, but it is not necessary in the non-homogeneous type]
