

## REINFORCED CONCRETE CANTILEVER AND COUNTER FORT RETAINING WALL

### 1.1 Retaining wall

A retaining wall is a structure, designed and constructed to resist the lateral pressure of soil.

Fig.1.1 Cantilever retaining wall

Fig.1.2 Counter fort retaining wall

Fig.1.3 Cantilever retaining wall

## 1.2 Design for Cantilever Retaining wall For Stem

### Example 1

Design a stem for cantilever retaining wall to retain an earth embankment with a horizontal top 4m above ground level. Density of earth =  $18 \text{ KN/m}^3$ . Angle of internal friction  $\phi = 30$  degree. SBC of soil =  $200 \text{ KN/m}^2$ . Coefficient of friction between soil and concrete = 0.5. Adopt M20 grade concrete and Fe 415 HYSD bars.

Given data :

Density of earth  $\gamma = 18 \text{ KN/m}^3$

Angle of internal friction  $\phi = 30$

SBC of soil  $q = 200 \text{ KN/m}^2$

Fig.1.4 Cantilever retaining wall

Step 1: Dimensions of retaining wall

$$\begin{aligned}
 \text{(a) Depth of foundation} &= q / \gamma (1 - \sin \phi / 1 + \sin \phi)^2 \\
 &= 200 / 18 (1 - \sin 30 / 1 + \sin 30)^2 \\
 &= 1.2\text{m}
 \end{aligned}$$

Fig.1.5 Cantilever retaining wall (Depth of foundation)

$$\begin{aligned}
 \text{(b) Overall depth of wall} &= 4 + 1.2 \\
 \text{'H'} &= 5.2\text{m} \\
 &= 5200\text{mm}
 \end{aligned}$$

Fig.1.6 Cantilever retaining wall (Overall depth of wall)

$$\begin{aligned}
 \text{(c) Thickness of base slab} &= H / 12 \\
 &= 5200 / 12 \\
 &= 433\text{mm} \sim 450\text{mm}
 \end{aligned}$$

$$\begin{aligned}
 \text{(d) Height of stem 'h'} &= 5200 - 450 \\
 &= 4750\text{mm} \\
 &= 4.75\text{m}
 \end{aligned}$$

Fig.1.7 Cantilever retaining wall (Thickness of base slab)

(e) Width of base slab 'b' = 0.5H to 0.6H  
= 2600 to 3120  
= 3000mm

Fig.1.8 Cantilever retaining wall (Width of base slab)

**Step 2 : Design of stem****(a) Max BM at base**

$$'M' = K_a (\gamma h^3 / 6)$$

$$\begin{aligned} \text{i.e } K_a &= (1 - \sin \phi / 1 + \sin \phi) \\ &= (1 / 3) (18 \times 4.75^3 / 6) \\ &= 107.2 \text{ KNm} \end{aligned}$$

$$\text{Factored moment 'Mu' } = 107.2 \times 1.5$$

$$= 161 \text{ KNm}$$

$$= 161 \times 10^6 \text{ Nmm}$$

**(b) Effective depth required**

$$d = \sqrt{\frac{Mu}{0.138 \times f_{ck} \times b}}$$

$$d = \sqrt{\frac{161 \times 10^6}{0.138 \times 20 \times 10^3}}$$

$$= 241.5 \sim 242 \text{ mm}$$

$$\text{i.e } b = 1000 \text{ mm}$$

$$= 10^3 \text{ mm}$$

$$f_{ck} = 20 \text{ N/mm}^2$$

**(b) Effective depth at base of stem**

$$\text{overall depth 'D' } = 450 \text{ mm}$$

$$\text{cover} = 50 \text{ mm}$$

$$\text{effective depth 'd' } = D - 50$$

$$= 450 - 50$$

$$= 400\text{mm}$$

(c) Find  $A_{st}$

$$M_u = (0.87 f_y A_{st} d) [(1 - A_{st} f_y) / (b d f_{ck})]$$

Page no. 96 , IS 456:2000

$$161 \times 10^6 = (0.87 \times 415 \times A_{st} \times 400) [(1 - 415 \times A_{st}) / (1000 \times 400 \times 20)]$$

$$161 \times 10^6 = (144.42 \times 10^3 A_{st}) [(1 - 5.187 \times 10^{-5} A_{st})]$$

$$161 \times 10^6 = (144.42 \times 10^3 A_{st}) - (7.49 A_{st}^2)$$

$$161 \times 10^6 - (144.42 \times 10^3 A_{st}) + (7.49 A_{st}^2) = 0$$

(using calculator) mode > Eqn > degree > 2

$$a = 7.49$$

$$b = -144.42 \times 10^3$$

$$c = 161 \times 10^6$$

$$x_1 = 18093\text{mm}^2$$

$$x_2 = 1188\text{mm}^2$$

$$A_{st} = 1188\text{mm}^2$$

Find spacing

Provide 16mm dia bars

$$\text{Spacing} = 1000 \times [(\pi d^2 / 4) / A_{st}]$$

$$= 1000 \times [(\pi \times 16^2 / 4) / 1188]$$

$$= 169.24 \sim 170\text{mm}$$

Provide 16mm dia bars at 170mm c/c

Find distribution reinforcement

$$\begin{aligned} A_{st}(\text{dist}) &= (0.12 / 100) \times bD \\ &= (0.12 / 100) \times 1000 \times 450 \\ &= 540 \text{ mm}^2 \end{aligned}$$

Provide 10mm dia bars

$$\begin{aligned} \text{Spacing} &= 1000 \times (\pi d^2 / 4) / A_{st} \\ &= 1000 \times [(\pi \times 10^2 / 4) / 540] \\ &= 145 \text{ mm} \end{aligned}$$

Provide 10mm dia bars at 145mm c/c

Provide 10mm dia bars at 290mm c/c on both faces

Step 3: Stability calculation

Fig.1.8 Cantilever retaining wall (Stability calculation)

(a) Find load

$$\begin{aligned}
 w1 &= (b \times d \times \gamma_c) + \left(\frac{1}{2} \times bh \times \gamma_c\right) \\
 &= (0.2 \times 4.75 \times 24) + \left(\frac{1}{2} \times 0.25 \times 4.75 \times 24\right) \\
 &= 22.80 + 14.25 \\
 &= 37.05 \text{ KN}
 \end{aligned}$$

Fig.1.8 Cantilever retaining wall (Stability calculation)

$$\begin{aligned}
 w2 &= b \times d \times \gamma_c \\
 &= 3 \times 0.45 \times 24 \\
 &= 32.40 \text{ KN}
 \end{aligned}$$

$$\begin{aligned}
 w3 &= b \times d \times \gamma_s \\
 &= 1.55 \times 4.75 \times 18 \\
 &= 132.50 \text{ KN}
 \end{aligned}$$

$$\begin{aligned}
 \text{Total load} &= w1 + w2 + w3 \\
 &= 201.95 \text{ KN}
 \end{aligned}$$

(b) Find moment @ a

$$\begin{aligned}
 M1 &= W1 \times \text{Length} \\
 &= (22.80 \times 1.65) + (14.25 \times 1.83) \\
 &= 37.62 + 26.07 \\
 &= 63.69 \text{ KNm}
 \end{aligned}$$

$$\begin{aligned}
 M2 &= W2 \times \text{Length} \\
 &= 32.40 \times 1.5 \\
 &= 48.60 \text{ KNm}
 \end{aligned}$$

$$\begin{aligned}
 M3 &= W3 \times \text{Length} \\
 &= 132.50 \times 0.78 \\
 &= 103.35 \text{ KNm}
 \end{aligned}$$

$$M4 = 107.2 \text{ KNm ( Moment at base)}$$

$$\begin{aligned}
 \text{Total moment } M &= M1 + M2 + M3 + M4 \\
 &= 322.81 \text{ KNm}
 \end{aligned}$$

Point of application

$$\begin{aligned}
 Z &= \Sigma M / \Sigma W \\
 &= 322.81 / 201.95 \\
 &= 1.6\text{m}
 \end{aligned}$$

Eccentricity

$$\begin{aligned}
 e &= Z - b/2 \\
 &= 1.6 - (3/2) \\
 &= 0.1\text{m}
 \end{aligned}$$

i.e  $b = 3$  (width of base slab)

$$e < b/6$$

$$b/6 = 3/6$$

$$= 0.5$$

$$0.1 < 0.5$$

Hence safe

Max and Min pressure at base

$$\sigma = \sum W / b [ 1 \pm (6e / b) ]$$

$$= 201.95/3 [ 1 \pm (6 \times 0.1 / 3) ]$$

$$\sigma_{\max} = 67.32 [ 1 + 0.2 ]$$

$$= 80.78 \text{ KN/m}^2$$

$$\sigma_{\min} = 67.32 [ 1 - 0.2 ]$$

$$= 53.85 \text{ KN/m}^2$$

Fig.1.9 Cantilever retaining wall (Stability calculation Top view)

Step 4 : Check for safety against sliding

$$\begin{aligned} P &= K_a \times \gamma (H^2 / 2) \\ &= (1/3) \times 18 \times (5.2^2 / 2) \\ &= 81.12 \text{KN} \end{aligned}$$

$$\text{i.e } K_a = (1 - \sin \phi / 1 + \sin \phi)$$

$$\begin{aligned} \text{F.O.S against sliding} &= (\mu W / P) \\ &= (0.5 \times 201.95 / 81.12) \\ &= 1.24 < 1.5 \end{aligned}$$

$$\mu = 0.5 \text{ (given)}$$

Since the wall is unsafe , so a shear key is to be designed below the stem

Step 5 : Design of shear key

Intensity of passive pressure in shear key front

$$P_p = K_p \times (\sigma_{\max}) \text{ pressure in shear key front}$$

$$K_p = (1 + \sin \phi / 1 - \sin \phi)$$

$$= (1 + \sin 30 / 1 - \sin 30)$$

$$= 3$$

$$P_p = K_p \times (\sigma_{\max}) \text{ pressure in shear key front}$$

$$= 3 \times 71.78$$

$$= 215.34 \text{ KN/m}^2$$

$$\text{Passive force PF} = P_p \times a$$

$$= 215.34 \times 0.45$$

$$= 97 \text{KN}$$

$$\begin{aligned}
 \text{F.O.S against sliding} &= [ (\mu W + PF) / P ] \\
 &= \{ [(0.5 \times 201.95) + 97] / 81.12 \} \\
 &= 2.4 > 1.5
 \end{aligned}$$

Hence safe

Minimum % of reinforcement in shear key

$$\begin{aligned}
 A_{st} &= (0.3/100) \times bD \\
 &= 0.003 \times 1000 \times 450 \\
 &= 1350 \text{ mm}^2
 \end{aligned}$$

Provide 16mm dia bars

$$\begin{aligned}
 \text{Spacing} &= 1000 \times (\pi d^2 / 4) / A_{st} \\
 &= 1000 \times [(\pi \times 16^2 / 4) / 1350] \\
 &= 148.9 \text{ mm} \sim 150 \text{ mm}
 \end{aligned}$$

Provide 16mm dia bars at 150mm c/c

Step 6 : Find shear stress

$$\begin{aligned}
 \text{Shear force 'V'} &= 1.5P - \mu W \\
 &= (1.5 \times 81.12) - (0.5 \times 201.95) \\
 &= 20.7 \text{ KN}
 \end{aligned}$$

Factored Shear force

$$\begin{aligned}
 \text{'V}_u\text{' } &= 20.7 \times 1.5 \\
 &= 31.05 \text{ KN}
 \end{aligned}$$

$$\begin{aligned}
 \text{Shear stress } \tau_v &= V_u / bd \\
 &= 31.05 \times 10^3 / (1000 \times 400) \\
 &= 0.077 \text{ N/mm}^2
 \end{aligned}$$

Find  $\tau_c$

$$\begin{aligned}
 100A_{st} / bd &= 100 \times 1350 / (1000 \times 400) \\
 &= 0.335 \text{ N/mm}^2
 \end{aligned}$$

Table 19, page no. 73 ,IS 456 2000

$$0.25 \text{ --- } 0.36$$

$$0.50 \text{ --- } 0.48$$

$$(0.36+0.48) / 2 = 0.42$$

$$\tau_c = 0.42 \text{ N/mm}^2$$

$$\tau_c > \tau_v$$

Hence safe
